

Program overview

08-Dec-2022 11:14

Year 2022/2023
Organization Civil Engineering and Geosciences
Education Bachelor Civil Engineering

Code	Omschrijving	ECTS	p1	p2	p3	p4	p5
CT Bachelor 2022							
CT BSc 1e jaar 2022							
CTB1000	Construction Site 1	8					
CTB1000-D1	Werkboek	2					
CTB1000-D2	Tekenen en planning	2					
CTB1000-D3	Diverse software	2					
CTB1000-D4	CAD/BIM/BEM	2					
CTB1001-16	Analyse	6					
CTB1001-16 Toets 1	Analyse deeltentamen 1	3					
CTB1001-16 Toets 2	Deeltoets periode 1	0					
CTB1001-16 Toets 3	Analyse deeltentamen 2	3					
CTB1001-16 Toets 4	Deeltoets periode 2	0					
CTB1002	Lineaire Algebra	6					
CTB1002 Toets 1	Toets 1	3					
CTB1002 Toets 2	Toets 2	3					
CTB1110-17	Construction Mechanics 1	5					
CTB1110-17 Toets 1	Ethics CTB1110-17	0					
CTB1110-17 Toets 2	Structural Mechanics 1	5					
CTB1120-17	Introduction to Civil Engineering	5					
CTB1120-17 Toets 1	Deeltoets 1	0					
CTB1120-17 Toets 2	Deeltoets 2	0					
CTB1120-17 Toets 3	Ethics CTB1120-17	0					
CTB1120-17 Toets 4	Workshops	0					
CTB1120-17 Toets 5	Projectanalyse	2					
CTB1120-17 Toets 6	Integrale Toets	3					
CTB1210	Dynamica & Modelvorming	5					
CTB1220-17	Integrated Design and Control	5					
CTB1220-17 Toets 1	Deeltoets 1	0					
CTB1220-17 Toets 2	Deeltoets 2	0					
CTB1220-17 Toets 3	Ethics CTB1220-17	0					
CTB1220-17 Toets 4	Project	3,5					
CTB1220-17 Toets 5	Integrale Toets	1,5					
CTB1310	Construction Mechanics 2	5					
CTB1320-17	Construction Materials and Sustainability	5					
CTB1320-17 Toets 1	Deeltoets 1	0					
CTB1320-17 Toets 2	Deeltoets 2	0					
CTB1320-17 Toets 3	Ethics CTB1320-17	0					
CTB1320-17 Toets 4	Case study	0,5					
CTB1320-17 Toets 5	Integrale Toets	4,5					
CTB1410-20	Design of Structures and Foundations 1	5					
CTB1410-20 Toets 1	Constructies en Funderingen	3					
CTB1410-20 Toets 2	Ontwerp practicum	2					
CTB1420-17	Transport en Planning	5					
CTB1420-17 Toets 1	Deeltentamen Delen 1 en 2 van het dictaat	0					
CTB1420-17 Toets 2	Deeltentamen Delen 3 en 4 van het dictaat	0					
CTB1420-17 Toets 3	Ethics CTB1420-17	0					
CTB1420-17 Toets 4	Oefening CTB1420-17	1					
CTB1420-17 Toets 5	Integrale Toets Delen 1 t/m 5	4					
CT BSc 2e jaar 2022							
CTB2000-20	Construction Site 2	8					
CTB2000-20-D1a	Programmeren 1	1					
CTB2000-20-D1b	Vloeistofmechanica practicum	1					
CTB2000-20-D2a	Programmeren 2	1					
CTB2000-20-D2b	Materiaalkunde practicum	1					
CTB2000-20-D3a	Programmeren 3	1					
CTB2000-20-D3b	Grondmechanica practicum	1					
CTB2000-20-D4a	Programmeren 4	1					
CTB2000-20-D4b	Numerieke wiskunde practicum	1					
CTB2105	Differentiaalvergelijkingen	3					
CTB2105 Toets 1	Exam	3					
CTB2105 Toets 2	Practical	0					
CTB2110	Fluid Mechanics	5					
CTB2121	Urban Water and Environmental Technology	5					

CTB2121 Toets 1	Deeltentamen Stedelijk Water	0	
CTB2121 Toets 2	Deeltentamen Milieutechniek	0	
CTB2121 Toets 3	Integraal tentamen	3	
CTB2121 Toets 4	Integrale opdracht	2	
CTB2121 Toets 5	Workshop	0	
CTB2200	Kansrekening & Statistiek	3	
CTB2210	Construction Mechanics 3	5	
CTB2220-14	Concrete and Steel Structures	5	
CTB2220-14 Toets 1	Deeltoets 1	0	
CTB2220-14 Toets 2	Deeltoets 2	0	
CTB2220-14 Toets 3	Oefening	0	
CTB2220-14 Toets 4	Integrale Toets	5	
CTB2300	Dynamics of Systems	3	
CTB2310	Soil Mechanics	5	
CTB2320-17	Design of Structures and Foundations 2	5	
CTB2320-17 Toets 1	Deeltoets 1	0	
CTB2320-17 Toets 2	Deeltoets 2	0	
CTB2320-17 Toets 3	Ethics CTB2320-17	0	
CTB2320-17 Toets 4	Practicum	2	
CTB2320-17 Toets 5	Integrale Toets	3	
CTB2400	Numerical Mathematics	3	
CTB2410	Hydraulic Engineering	5	
CTB2420-17	Hydrology	5	
CTB2420-17 Toets 1	Deeltoets 1	0	
CTB2420-17 Toets 2	Deeltoets 2	0	
CTB2420-17 Toets 3	Ethics CTB2420-17	0	
CTB2420-17 Toets 4	Practicum	0	
CTB2420-17 Toets 5	Integrale Toets	5	
CT BSc 3e jaar 2022			
CT BSc 3e jaar - minor			
CT BSc 3e jaar - major			
CTB3000-16	Bachelor Thesis	10	
CTB3000-16 Toets 1	Ethics	0	
CTB3000-16 Toets 2	Presentation	10	
CTB3310	Surveying and Mapping	4	
CTB3310 Toets 1	Practicum	0	
CTB3310 Toets 2	Tentamen	4	
CTB3320	Road and Railway Design	4	
Overzicht Specialisatievakken. Student dient drie specialisatievakken te kiezen uit de lijsten hieronder			
Sterk aanbevolen als voorbereiding op de MSc Environmental Engineering, kies 3 uit:			
CTB3311	Climate Impacts and Engineering	4	
CTB3311 Toets 1	Exam	2,5	
CTB3311 Toets 2	Assignment	1,5	
CTB3350	Open Channel Flow	4	
CTB3360	Water System Analysis	4	
CTB3365-16	Introduction to Water Treatment	4	
CTB3390	Mechanics and Transport by Flow through Poreus Media	4	
CTB3415	Water Management Research	4	
Sterk aanbevolen als voorbereiding op de MSc Civil Engineering, kies 3 uit:			
CTB3330	Structural Mechanics 4	4	
CTB3335	Concrete Structures 2	4	
CTB3340-15	Building Structures 1	4	
CTB3350	Open Channel Flow	4	
CTB3355	Hydraulic Structures	4	
CTB3370-18	Geometrical Design of Roads and Railways	4	
CTB3385	Use of Underground Space	4	
CTB3390	Mechanics and Transport by Flow through Poreus Media	4	
CTB3420	Integral Design of Infrastructure	4	
CTB3425-17	Monitoring and Stability of Dikes and Embankments	4	

Year	2022/2023
Organization	Civil Engineering and Geosciences
Education	Bachelor Civil Engineering

CT Bachelor 2022

Year	2022/2023
Organization	Civil Engineering and Geosciences
Education	Bachelor Civil Engineering

CT BSc 1e jaar 2022

CTB1000	Construction Site 1	8
Responsible Instructor	Ir. S. Pasterkamp	
Contact Hours / Week x/x/x/x	4/4/4/4	
Education Period	1 2 3 4	
Start Education	1 2 3 4	
Exam Period	none	
Course Language	Dutch	
Course Contents	Zie deelvakken CTB1000-D1, CTB1000-D2, CTB1000-D3, CTB1000-D4	
Study Goals	Zie deelvakken CTB1000-D1, CTB1000-D2, CTB1000-D3, CTB1000-D4	
Education Method	Zie deelvakken CTB1000-D1, CTB1000-D2, CTB1000-D3, CTB1000-D4	
Course Relations	Elk deelvak van de Bouwplaats heeft relaties met andere vakken die tegelijkertijd met dat deelvak gegeven worden. Er wordt samengewerkt met name op de onderwerpen (bijvoorbeeld een gebouw, een brug) waarmee geoefend wordt. Een constructie kan bijvoorbeeld bij Constructief Ontwerpen ontworpen, en in de Bouwplaats getekend worden.	
Assessment	Zie deelvakken CTB1000-D1, CTB1000-D2, CTB1000-D3, CTB1000-D4	
Tags	Design Drawing Group work Intensive Modelling Practicals Process Project Software	
Expected prior Knowledge	None	
Academic Skills	Zie deelvakken CTB1000-D1, CTB1000-D2, CTB1000-D3, CTB1000-D4	
Literature & Study Materials	Zie deelvakken CTB1000-D1, CTB1000-D2, CTB1000-D3, CTB1000-D4	
Judgement	Zie deelvakken CTB1000-D1, CTB1000-D2, CTB1000-D3, CTB1000-D4	
Permitted Materials during Exam	N/A	
Collegerama	No	

CTB1000-D1	Werkboek	2
Responsible Instructor	Ir. S. Pasterkamp	
Contact Hours / Week x/x/x/x	4/0/0/0	
Education Period	1	
Start Education	1	
Exam Period	1 2	
Course Language	Dutch	
Parts	Practicummiddagen waarin de verschillende vaardigheden worden bijgebracht door het maken van oefeningen.	
Summary	Het voornaamste doel van dit vak is om te leren: Rapporteren, dataverzameling, tekenen	
Course Contents	Rapportagetechniek Brightspace course Information Literacy 1 Handschetsen Technisch tekenen	
Study Goals	M.b.t. rapporteren kan de student: - Een effectief technisch rapport schrijven; - Een effectieve structuur voor een technisch rapport opzetten; - Een effectieve introductie en samenvatting schrijven; - Overtuigende conclusies en aanbevelingen schrijven; - Een duidelijke en aantrekkelijke schrijfstijl gebruiken; - Functionele illustraties en tabellen gebruiken. M.b.t. de kennisverwerving kan de student: - de kennisbehoefte vaststellen. - gericht zoeken door middel van een zoekplan. - de gevonden informatie beoordelen op bruikbaarheid en betrouwbaarheid. - informatie bronnen weergeven in een database en in groepsverband beheren. M.b.t. tekenen kan de student: - Het vaardig gebruiken van potlood, pennen, stiften, liniaal, tekenpapier, schetsrol - Kijken en vertalen naar papier: het snel kunnen omzetten van een object dat je in het echt ziet (bijv. gebouw, brug, weg, sluis, viaduct, constructie of onderdelen hiervan) in een 2D of 3D handschets - Ontwerpen: het snel kunnen maken van een 2D of 3D handschets van (een onderdeel van) een zelf bedachte technische oplossing - Het hebben dan wel ontwikkelen van ruimtelijk inzicht - Het kunnen communiceren met anderen op basis van schetsen en uitwerking hiervan in een technische tekening - Begrijpen en toepassen van de Amerikaanse projectie; - Ruimtelijk inzicht en het vertalen van 3D naar 2D; - Opbouw van een technische tekening; - Maken van een eenvoudige technische tekening; - Toepassen van de tekenregels; - Aanduiding van details in tekeningen; - Intekenen van betonwapening; - Nieuwe vormen van maataanduiding; - Maataanduidingen door middel van bijschriften; - De opbouw van de hoofddragconstructie van een eenvoudige hal begrijpen. Studielast: - Ca. 4 u/w begeleid, 4 u/w zelfstudie	
Education Method	Opdrachtmiddagen, zelfstudie	
Course Relations	Inleiding civiele techniek	
Assessment	De leerdoelen worden getoetst door middel van: Opdrachten Alle opdrachten moeten als voldoende beoordeeld zijn.	
Tags	Drawing	
Expected prior Knowledge	None	
Academic Skills	Drawing, academic writing, referencing your work, preventing plagiarism, finding information in a library	
Literature & Study Materials	Rapportagetechniek, 5e druk 2015, verkrijgbaar bij VSSD Tekenset, verkrijgbaar bij de VSSD Dictaat CTB1000 Technisch Tekenens Versie Juli 2013, verkrijgbaar via Microweb	
Judgement	Voor informatie over de beoordeling zie artikel 14 van de Regels en Richtlijnen (RRvE), alsmede artikel 9 van de bijlage bij de Onderwijs- en Examenregeling (OER): https://www.tudelft.nl/en/student/ceg-student-portal/education/education-information/educational-rules-and-regulations	
Permitted Materials during Exam	N/A	
Collegerama	No	

CTB1000-D2	Tekenen en planning	2
Responsible Instructor	Ir. S. Pasterkamp	
Contact Hours / Week x/x/x/x	0/4/0/0	
Education Period	2	
Start Education	2	
Exam Period	2 3	
Course Language	Dutch	
Parts	Practicummiddagen waarin de verschillende vaardigheden worden bijgebracht door het maken van oefeningen.	
Summary	Het voornaamste doel van dit vak is om te leren: Projectvaardigheden	
Course Contents	Technisch handtekenen Eenvoudig CAD-tekenen (SketchUp) Opstellen (financiële) planning	
Study Goals	De fasering van een project kunnen benoemen; Samenwerken in een projectgroep; Resultaten presenteren; Aan te geven waar de eigen voorkeuren en kwaliteiten liggen m.b.t. de werkzaamheden in de verschillende fasen; de inpassing van subsystemen (bouwwerken) in een omgeving vaststellen en weergeven; de vorm van een ontwerp vertalen in de werking (hetgeen er wordt bewerkstelligd), de wijze van opbouw, werking en capaciteiten; de verschillen zien tussen een systeem, subsysteem en sub-subsysteem (van grof naar fijn); de werkelijkheid kritisch opnemen en weergeven; Het effect van het gebruik op de omgeving weergeven en dit vertalen in ofwel een knelpunt of randvoorwaarden voor toekomstige plannen; Herkennen eigen voorkeur qua rol in een project; Reflecteren op individuele inbreng in groepsproces; Project op systeem- en subsysteemniveau in kaart brengen aan de hand van plattegronden, schetsen en tekeningen; Een ontwerp inpassen in de omgeving; Een besluitvormingsproces in een groep doorgronden en beïnvloeden; Het opstellen van een Work breakdown Structure (WBS); Het maken van een projectplanning dmv planningssoftware; Sketchup basisvaardigheden SketchUp; 3D schetsen met de computer; presentatie-afbeeldingen maken. Studielast: Ca. 4 u/w begeleid, 4 u/w zelfstudie	
Education Method	Opdrachtmiddagen	
Course Relations	Integraal Ontwerp (1)	
Assessment	De leerdoelen worden getoetst door middel van: Opdrachten Alle opdrachten moeten als voldoende beoordeeld zijn.	
Tags	Drawing Personal Software	
Expected prior Knowledge	None	
Academic Skills	drawing, working in groups, finding information in a library	
Literature & Study Materials	Alle lesmateriaal wordt gepresenteerd via Brightspace.	
Judgement	Voor informatie over de beoordeling zie artikel 14 van de Regels en Richtlijnen (RRvE), alsmede artikel 9 van de bijlage bij de Onderwijs- en Examenregeling (OER): https://www.tudelft.nl/en/student/ceg-student-portal/education/education-information/educational-rules-and-regulations

Parts	Part I - Construction Materials: This course provides an introductory overview of the general material science and various materials used in construction. The main objective of this course is to provide the students with fundamental knowledge and understanding of how materials are built-up and what are the relationship between important chemical/physical properties and material behavior. Part I - Construction Materials lectures are given in English Part II - Sustainability: In this part of the course the interaction between materials and the environment, and the resulting consequences for both, will be treated. Production and use of materials go at the expense of finite resources and production of environmental harmful compounds while at the same time environmental conditions affect materials durability and functionality aspects. Focus will be on the quantification of Sustainability using Life Cycle Assessment (LCA) methods. Part II - Sustainability lectures are given in Dutch	
Course Contents	Part I: Construction Materials Part II: Sustainability Case studies for Sustainability	
Study Goals	PART I - Construction Materials Define material science and material engineering. Classify main construction materials. Tell importance of standards and standardization in material production, selection and use Define and illustrate the basic properties of atoms, different atomic bonds, crystal structures and dislocations. Relate bonding properties to the physical properties of materials. Relate chemistry to mechanics Define stress and strain, classify different material behavior under stress, define Poissons ratio. Classify and analyze E-modulus on stress-strain diagrams Differentiate elastic and plastic behavior. Define and compute tensile and compressive stress, list effect of testing parameters, define material hardness. Define and explain simple fracture, brittle fracture, and ductile fracture, explain fractography, surface energy and strain energy, derive the Griffiths equation. Define and formulate stress concentrations, fracture toughness, fracture modes. Discuss plain fracture design strategy, fracture toughness testing, and fatigue. Tell importance of phase diagrams, relate to microstructure and mechanical properties of materials. Define and apply lever rule. Define and classify ferrous alloys. Explain iron, important iron ores and their chemical properties. Define steel, compare steel with other iron alloys. Illustrate iron-iron carbide systems. Explain various Fe-C microstructures. Explain the effect of carbon content on the stress-strain behavior of steel. Define rock, tell importance of rocks in civil engineering. Define and discuss the difference between rocks and aggregate. Define gradation, illustrate grading curve. Discuss importance of grading, define fineness modulus, max. aggregate size and other physical properties of aggregates. Define portland cement, compare hydraulic and nonhydraulic binders, define and compare paste, mortar and aggregate. Summarize characteristics of main cement phases. Define cement hydration, hydration reactions, and heat of hydration, Discuss effect of cement minerals on the strength development of concrete. List components of modern concrete. Classify concrete admixtures. Define and discuss concrete technology, fresh and hardened concrete, mix design, classify of concrete based on weight and strength. List properties of hardened concrete, explain concrete strength and relate to W/C ratio and degree of hydration. Define W/C and discuss its importance for quality of concrete. Illustrate W/C vs. Strength and W/C vs. capillary porosity. Explain the concept of durability of concrete. Compare durability with sustainability. Explain and discuss mechanisms and characteristics of main durability problems. Design durable concrete based on accumulated knowledge. Define types and characteristics of structural wood and timber. Explain mechanical properties and durability issues related to wood and timber. PART II - Sustainability Define, characterize and analyse sustainable construction materials Quantification of Sustainability: Master the application of Life Cycle Assessment (LCA) methods Analyse environmental element cycling and interaction with construction materials Classify environmental aspects of raw material use and emissions of harmful substances Explain in sustainability context choices between application of finite and renewable raw materials for civil engineering practices Discuss examples of research concerning development of innovative bio-based sustainable materials Ethics aspects of environmental and materials engineering Study load: PART I: Lecture hours: 24hrs Self study: 56hrs PART II: Lecture hours: 16hrs Case study: 14 hrs Self study: 30 hrs	
Education Method	Lecture hours and self study	
Course Relations	This course forms the fundamentals of the following courses: All civil engineering materials related courses in the M.Sc. program. Bouwplaats	
Assessment	The final grade will be calculated from: 2x examinations (for Construction Materials and Sustainability)	

	The examinations will be carried out in computer-based Maple T.A. environment as long as sufficient facilities can be arranged for the entire number of students. Lecturers will announce the examination style well before the first midterm examination. Recovery (integral) examination covers the entire course content. Midterm exams have a duration of 90 minutes. The integral exam has a duration of 180 minutes. A case study assignment (pass/fail) is used for the assessment of the sustainability part. If a student fails the case study, he/she may not pass the course irrespective to his/her exam grades.
Expected prior Knowledge	VWO level chemistry and physics
Academic Skills	conceptual thinking, research, reporting, reasoning, problem solving
Literature & Study Materials	for PART I - Construction Materials: Materials Science for Civil Engineering - Lecture Notes by Dr. O. Copuroglu Additional reading material for further study (available at the library): Any fundamental material science textbook such as: - Callister, William D., and David G. Rethwisch. Fundamentals of materials science and engineering. Wiley, 2013. - Ashby, Michael F., Hugh Shercliff, and David Cebon. Materials: engineering, science, processing and design. Butterworth-Heinemann, 2013. - Materials Science in Design and Engineering, P. van Mourik, J. van Dam, S. Picken, 2012, VSSD publishing. (Also available in Dutch) also any textbook on materials of construction is recommended: - Construction Materials: Their Nature and Behaviour, 3rd ed. Edited by J . M . Illston and P . L . J . Spon Press 2001, Print ISBN: 978-0-419-25860-5 eBook ISBN: 978-0-203-47898-1 3rd ed. is free for the TU Delft students at: http://www.crcnetbase.com/isbn/978-0-419-25860-5 The following ebook is obligatory for PART II - Sustainability: Reader CTB1320 Sustainability For both parts: PDF files of the lecture slides and homework exercises
Judgement	Final grade = 1st partial examination (50%) + 2nd partial examination (50%) or Resit = integral exam (100%) The case study assignment is graded with a pass/fail. minimum partial examination score must be 5.0 For more information on grading, see article 14 in the Rules and Guidelines (RGBE): https://www.tudelft.nl/en/student/ceg-student-portal/education/education-information/educational-rules-and-regulations
Permitted Materials during Exam	Classical Calculators (No tablet computers or mobile devices are allowed) Aid sheet: An aid sheet will be distributed by the lecturers during the examination. Therefore no self-made aid sheet is allowed
Collegerama	Yes

Course Language	Dutch English	
Expected prior knowledge	Dynamics and Modelling Differential Equations for civil engineering	
Parts	The course consists of lectures in which the course content is provided.	
Summary	To be able to model and analyse the dynamic behaviour of several civil engineering systems	
Course Contents	Mechanical system with one degree of freedom, undamped. Formulate equations of motion for free vibration. Forced vibrations for harmonic, exponential, step and impact/pulse loads. Application of initial conditions. Hydraulic systems with one degree of freedom without damping; also free and forced motion. Mechanical system with damping; free and forced vibrations. Hydraulic system with damping; free and forced motion. First order systems as a limit case of 2nd-order systems. Mechanical systems with two degrees of freedom, without damping. Formulate equations of motion (mass matrix, stiffness matrix). Determination of eigenfrequencies and eigenperiods. Forced response for harmonic loads.	
Study Goals	Learning Objectives (LO): LO1: To recognize the properties of structural and hydraulic civil engineering systems (for example mass, elasticity, discharges), that are essential for the modelling of such systems. LO2: To be able to formulate simple equations of motion, using the second Newtons Law, with the help of the displacement method. LO3: To be able to analytically derive solutions for formulated equations of motion. LO4: Interpret solutions with respect to the fundamental dynamics parameters, like: eigenfrequency, eigenperiod, free and forced motion, resonance, and steady-state motion. LO5: To be able to predict design improvements for dynamic systems that have been studied. 30 hours lectures 3 hours exam 51 hours individual study and exam preparation -----+ 84 hours (3 ECTS)	
Education Method	Lectures, tutorials	
Course Relations	Dynamics Structural mechanics courses	
Literature and Study Materials	Study guide with general information (BrightSpace) Lecture Notes: "Dynamica van Systemen", J. Blaauwendraad, versie 2010. Lecture Slides Other course materials: "Dynamica van Systemen, Vragenstukkenbundel (oefen- en tentamenopgaven)", Studentassistenten CT2022, versie 2011.	
Assessment	Written exam, with open questions	
Permitted Materials during Tests	Calculator and a sheet with main formulas. The latter will be given at the exam together with the exam questions.	
Expected prior Knowledge	Dynamica & Modelforming; Constructuemechanica 1,2,3; Differentiaalvergelijkingen.	
Academic Skills	Analytical thinking; Critical appraisal.	
Literature & Study Materials	Study guide with general information (BrightSpace) Lecture Notes: "Dynamica van Systemen", J. Blaauwendraad, versie 2010. Colleggerama	Yes	

CTB2310	Soil Mechanics	5
Responsible Instructor	Prof.dr. M.A. Hicks	
Instructor	Dr. P.J. Vardon	
Contact Hours / Week x/x/x/x	0/0/6/0	
Education Period	3	
Start Education	3	
Exam Period	3 4	
Course Language	English	
Parts	The course is split into 2 parts: the first part is largely equivalent to the old Soil Mechanics 1 course; the second part is largely equivalent to the old Soil Mechanics 2 course.	
Summary	The course explains the basic concepts of theoretical and applied soil mechanics. Theoretical soil mechanics includes: Soil Characteristics; Groundwater; Geomechanics; Shear Strength of Soils. Applied soil mechanics includes: Retaining Structures; Foundations; Slope Stability.	
Course Contents	Soil Characteristics: Classification and mineralogy of soils; Grains, grain size distribution and porosity; Introduction to in situ testing. Groundwater: Pore pressure and effective stress; Darcys law, permeability and groundwater flow. Geomechanics: Stresses and initial stress state; Strains, stress-strain relationships and tangent modulus; Elastic solutions; Consolidation, drained and undrained behaviour. Shear Strength of Soils: Drained and undrained soil behaviour; total and effective shear strength parameters; Mohr circles; Mohr-Coulomb failure criterion; stress paths; shear test; triaxial test; site investigation; soil sampling. Retaining Structures: Lateral earth pressure at rest; passive and active pressures; Rankine; Coulomb; sheet pile walls; Blum. Foundations: Geotechnical bearing capacity; shallow and deep foundations; Prandtl; Brinch Hansen; pile foundations. Slope Stability: Limit equilibrium methods; vertical slope; infinite slope; method of slices; Fellenius; Bishop.	
Study Goals	The main goal of this course is to: Have an understanding of, and be able to apply, the following: Soil classification; In situ testing; Groundwater flow; Stresses in the ground; Strains and stiffness; Consolidation theory; Shear strength of soils; Laboratory and in situ testing; Earth retaining structures; Foundations; Slope stability. By the end of the course the student should be able to: Explain the various forms of soil behaviour, including the influence of soil properties, degree of saturation and loading rate. Evaluate laboratory data to determine material parameter values. Plan an engineering strategy for analysing geotechnical problems, involving settlements, consolidation, groundwater flow, basic foundations, retaining structures and slope stability. Analyse appropriately and evaluate geotechnical problems, utilising presented theory, on the following topics: elastic behaviour and settlements, consolidation, groundwater flow, basic foundations, retaining structures and slope stability. Study load: 36 lecture hours, 12 tutorial hours, 72 self-study hours, 17 exam preparation hours, 3 exam hours.	
Education Method	Lectures, tutorials and self-study.	
Course Relations	Design of Structures and Foundations 1 & 2	
Assessment	In 'de Bouwplaats' a soil mechanics practical will be executed The learning goals of this course will be tested with: Written examination (in English/Dutch) at the end of the course. Mid-term test must be passed to gain entry to the exam.	
Permitted Materials during Tests	Calculator as described in the Examination regulations Writing and drawing implements.	
Expected prior Knowledge	Structural Mechanics 1 Structural Mechanics 2 Fluid Mechanics	
Academic Skills	Analytical skills.	
Literature & Study Materials	Course book (optional): Soil Mechanics, A. Verruijt, Delft University of Technology, 2012. Go to: http://geo.verruijt.net/ and download the book (in English) stored as SoilMechBook2012.pdf Accompanying lectures notes (in the form of ppt slides). Worked examples.	
Judgement	Mid-term test must be passed to gain entry to the exam. Final mark = examination grade only. For more information on grading, see article 14 in the Rules and Guidelines (RGE): https://www.tudelft.nl/en/student/ceg-student-portal/education/education-information/educational-rules-and-regulations	
Permitted Materials during Exam	Standard calculator. Formula sheet will be provided.	
Colleggerama	Yes

Expected prior knowledge	analysis, calculus, linear algebra, differential equations	
Parts	During the lectures the most important points are highlighted. Motivation for the various parts of the lectures/book are given. Exercises are discussed and explained. There is a lot of material available on the corresponding website for information, motivation, exercises and old exams.	
Summary	After the course the student is able to design a simple numerical method, analyses it and implement it. Furthermore, the student should be able to consider the results of numerical methods, analyse them and explain their behaviour. An oral and/or written report of these findings can be given by the student.

Parts	lectures (7x2 hours) computer-based assignments/practical work/fieldwork (7x4 hours) self-study	
Summary	The goal of this course is to convey the basic concepts and techniques of geodesy, remote sensing and data science, from a civil engineering application perspective. This covers both conventional as well as modern, space-based, observation methods and techniques, and associated data processing, interpretation and visualization. The assignments and practical work are primarily about hands-on working with different sorts of equipment and data.	
Course Contents	The lectures and practical exercises cover, each week, in parallel, generic basic material in surveying and mapping (techniques, methods, data processing and analysis, and background), as well as examples of applications in practice (design, realization and maintenance of constructions and infrastructure, traffic, transport and planning, hydraulic engineering, water-management and environmental engineering). 1. Surveying for construction (tachymetry/total station, topographic/detail surveying and stake-out, observation modeling, parameter estimation) 2. Surveying for construction (design of measurement set-up, leveling, measurement uncertainty, variance, correlation, accuracy, error propagation, validation, interpolation, data quality control) 3. Photogrammetry (central projection, relation photo geometry - terrain geometry, stereo-photo, mapping, 3D-reconstruction) 4. Surveying for dynamic positioning (traffic, transport and navigation, infrastructure-construction), satellite-navigation systems: GPS/GNSS; 3D Digital Terrain Model (DTM) survey 5. Coordinate and reference-systems for on and off-shore surveying (RD, ETRS89, ITRS, NAP, geoid, MSL, LAT), offshore surveying (bathymetry by echo-sounding) 6. Remote Sensing observation-techniques (satellite missions, satellite orbit, sensors/payloads, techniques, optical and radar remote sensing, laser-altimetry and laser-scanning, error propagation, limitations, new developments as atmospheric remote sensing), flooding assessment with 3D terrain modelling (AHN, TOP10NL and QGIS) and vegetation analysis (NDVI, based on Sentinel data) 7. Cartography (map-projection, visualization, overlays, 3D-objects, terrain representation and idealization, Google Earth/Maps), working with spatial data (visualization and analysis, layers, modeling, Geographic Information System (GIS), available geo-information, PDOK), spatial precipitation (rainfall) analysis, thematic mapping (QGIS)	
Study Goals	Upon completion of this course, the student has: - working knowledge about, and understanding of, reference systems, observation techniques (leveling, total station/tachymetry and laser-scanning), uncertainties in measurements, measurement processes, satellite systems for surveying and mapping (remote sensing, GPS/GNSS), Geographic Information Systems (GIS), cartography, and visualisation - knowledge about, and understanding of the calculus of observation (waarnemingsrekening), and is able to apply this to actual problems (measurement data processing), and, analyse, evaluate, interpret and explain measures of quality of the survey, and the student is: - able to advise on the choice of measurement techniques for civil engineering geo-problems, and to design a measurement set-up - able to convert a measurement problem and set-up, into a mathematical model, to determine (estimate) the unknown parameters of interest based on the observed data, and to translate the outcome, including its quality (uncertainty), back into the application - able to interpret, analyse and present spatial geo-information Next to applying course-related knowledge and developing accompanying skills, the practicals of this course contribute to development of an academic attitude, specifically: - problem formulation and solving - interpretation of data and data processing results - writing short reports - reflect on outcomes of analyses (judgemental skills) - reasoning and arguing	
Education Method	weekly lectures weekly (supervised) practical work and assignments self-study Lectures and practical work and assignments are on-campus. Alternatively, on-line lectures and on-line (supervised) practical work and assignments. The computer-based assignments can be done on student's own PC/laptop This course is composed of: 7x2 = 14 hours of lectures 7x4 = 28 hours of practical work and assignments 8x7 = 56 hours of self-study (7 hours per week) 1x11 = 11 hours of preparation for exam 1x3 = 3 hours of examination - Total = 112 hours	
Course Relations	- Inleiding Civiele Techniek CTB1120-17 - Bouwplaats: CAD/BIM/BEM CTB1000 - Bouwplaats CTB2000 - Waterbouwkunde CTB2410 - Hydrologie CTB2420-17	
Assessment	practical - toets1 (series of assignments) the assignments have to be all completed within one academic year - results of individual assignments can not be transferred to another academic year practical is assessed by pass/fail (a minimum of 6 out of 7 assignments need to be passed) written exam (closed book) - toets2 mark for the written exam is the final grade for this course (once the practical has been completed with a pass)	

	alternatively, the written exam can be an on-line assessment (Brightspace, quizzes and assignment), taking place in the time slot scheduled for the exam

Exam Period	4	
Course Language	English	
Course Contents	Climate change is one of the dominant global long-term trends affecting the work of the civil engineer. It impacts the boundary conditions of coastal defence systems, off-shore engineering, water management and large infrastructure design. Optimal risk management and long term sustainability are only possible when the potential consequences of climate change are taken into account. Not only mitigation and adaption, but also the science behind climate change is an engineering problem, with several open-standing questions to solve. This course provides students with the current scientific knowledge of the climate system and the combined roles of the atmosphere and ocean therein, and helps prepare students for assessing the risks and uncertainties of climate impacts in relation to specific suggested engineering challenges. The course is structured in four modules that target global, regional and local impacts of climate change (Climate Sensitivity, Ocean Circulation and Weather Patterns, and Weather Extremes, including floods, droughts, heat waves and storms) and the impact of engineering choices on climate change (the Carbon Cycle). This course prepares students for the MSc tracks Environmental Engineering, Geoscience and Remote Sensing and Hydraulic Engineering.	
Study Goals	At the end of the course the student is able to: -Explain the basic principles of the interplay between oceans and atmosphere and their roles in climate and climate change. -Explain the concept of climate sensitivity using basic principles of the Earth's radiation balance and analyze uncertainties in the feedbacks that play a role in climate sensitivity. -Explain the role of oceanic and atmospheric circulations in weather patterns and storm systems and their sensitivity to global warming. -Explain the consequences of global warming on weather extremes, including floods, droughts, heat waves and hurricanes. -Estimate the different controls of the carbon cycle and assess the impact of engineering choices on atmospheric concentrations of greenhouse gases and associated climate change. -Evaluate the impacts and significance of climate change for a specific civil engineering challenge.	
Education Method	A combination of oral lectures explaining the theory behind climate science and practical lab sessions working towards a group assignment. Each week contains 4 hours of contact hours, including 2 hours of classical oral lectures and 2 hours of lab sessions. The labs include plenary exercises and discussions under the supervision of the instructors and feedback on the group assignment. In order to give optimal feedback, students are expected to study the course material prior to the lectures.	
Course Relations	Related to (BSc) courses on hydrological/meteorological/hydraulic engineering. Overlap with the MSc course Climate Change and Ethics will be minimal	
Assessment	Assessment is based on the ability of the student to apply theoretical information to 1) explain the role of the ocean and atmosphere in climate and climate change, 2) illustrate that knowledge in numerical exercises, 3) interpret specific processes of the coupled atmosphere-ocean system and 4) evaluate the role of climate for a specific engineering challenge. Grade based on written exam (60%) and written group report (40%). The minimum grade for the written exam is a 5. The resit in Q5 only applies to the written exam. The group report has to be completed in Q4.	
Expected prior Knowledge	Basic level mathematics, mechanics, hydrology, fluid dynamics (Bachelor level).	
Academic Skills	Remembering and understanding basic theoretical concepts. Demonstrating this understanding through the application of theory using the relevant equations. Critical thinking. Effective communication in discussions. Working in groups.	
Literature & Study Materials	Course syllabus and materials to be handed out in class.	
Judgement	For more information on grading, see article 14 in the Rules and Guidelines (RGBE): https://www.tudelft.nl/en/student/ceg-student-portal/education/education-information/educational-rules-and-regulations	
Permitted Materials during Exam	Only calculator. Basic formularium will be handed out.

Exam Period	3 4	
Course Language	English	
Expected prior knowledge	basic fluid mechanics, ordinary and partial differential equations, complex numbers	
Parts	lectures MAPLE TA tests	
Course Contents	Shallow-water equations, preliminary analyses and classification of waves; Elementary wave equation, solution method and analyses; Translatory waves, interaction with control structures, tidal bore; Method of characteristics, sub- and super-critical flow, transients in closed conduits; Tidal basins, influence resistance and inertia, resonance; Harmonic method, Lorentz-linearisation, tidal propagation in large systems; High water waves, kinematic waves and diffusion model, hysteresis.	
Study Goals	After mastering the course the student should be able to identify, analyze and compute various wave phenomena encountered in hydraulic engineering and water management that are governed by the one-dimensional shallow water equations. This relies on selective schematization and choosing adequate solution strategies which involves: - understanding the role of the hydrostatic pressure approximation - classification and analyses of waves based on resistance versus inertia - understanding the basic structure of elementary wave solutions - addressing initial and boundary conditions, (partial) reflection - graphical construction of solutions using the method of characteristics - analyses of small basins with discrete storage, resistance and inertia - analyses of traveling and standing waves in large basins including resistance - analyses of high water waves with dominant resistance, kinematic waves, diffusion model	
Education Method	lectures MAPLE TA tests (homework)	
Course Relations	fluid mechanics, dynamics, calculus, water management, hydraulic structures, computational modeling of flow and transport	
Literature and Study Materials	Textbook "Unsteady Flow in Open Channels", Jurjen Battjes and Robert Jan Labeur, Cambridge University Press, ed. 2017; available through VSSD, amazon.com, bol.com Available on BrightSpace: - lecture slides - answers to problem sets - compilation of assignments - various MatLab scripts and videos	
Assessment	written exam (summative) online MapleTA tests for self assessment (not compulsory)	
Permitted Materials during Tests	pen, pencils, ruler, eraser (graphical) non-programmable calculator as described in the examination regulations.	
Tags	Fluid Mechanics Physics Water Engineering Water management	
Expected prior Knowledge	introduction environmental fluid mechanics dynamics ordinary- and partial differential equations complex numbers

Expected prior knowledge	Fluid mechanics Introduction water management Introduction hydrology	
Course Contents	Central topic of the course is analysis and design of natural and man-made water systems (canals, rivers, agricultural fields, polders, irrigation systems, soils, aquifers) based on hydraulic and hydrological knowledge. Common flow processes encountered in practice are discussed, including open-channel flow, hydraulic structures, soil water flow, and groundwater flow. In particular, the course focuses on: (1) unified treatment of the physics of water flow in surface and subsurface systems based on the principles of mass and momentum conservation (2) basic numerical methods for solving the relevant flow equations (3) application of theory to existing systems from around the world. As such, the course consolidates and builds on prior knowledge obtained in other courses, and prepares for more advanced topics in the MSc Watermanagement program.	
Study Goals	The overall goal is to analyze and quantify water flow through natural and man-made systems such as canals, rivers, agricultural fields, polders, irrigation systems, soils, and aquifers. This requires the following: quantitative understanding of flow processes commonly encountered in practice, including open-channel flow, hydraulic structures, soil water flow, and groundwater flow translate a given practical flow situation into a mathematical model of water flow in the system apply basic numerical techniques for solving the resulting mathematical models interpret computed results and draw conclusions about the functioning of the water system under consideration, and, if applicable, formulate control actions to improve the situation Study load: Lectures: 7 x 2 hours Assignments: 6 x 10 hours Self study: 7 x 2 hours Exam preparation: 8 hours Final exam: 3 hours	
Education Method	Lectures and Assignments	
Course Relations	Water management, Hydrology	
Literature and Study Materials	All study materials (lecture slides) will be provided on BrightSpace	
Assessment	Weekly computer assignments and final exam, with a split of 40/60 or 60/40, whichever yields the higher final grade. You need a grade of 5.75 or higher on the exam.	
Permitted Materials during Tests	Calculator and A4 paper with formulas prepared by the student	
Expected prior Knowledge	Fluid mechanics Introduction water management Introduction hydrology	
Academic Skills	Analytical thinking Report writing Problem solving

Parts	Drinking Water Treatment Wastewater Treatment	
Summary	Understand the process units and make a process design of a drinking water and wastewater treatment plant	
Course Contents	This course deals with the basic principles and design aspects of sanitary engineering infrastructure. This comprises: drinking water quality and treatment and wastewater characteristics and treatment	
Study Goals	At the end of this course you will be able to: 1. Identify the drinking water quality parameters to be improved and explain what treatment chain or scheme is needed 2. Calculate the dimensions of the drinking water treatment processes 3. Draw drinking water treatment schemes 4. Identify the wastewater quality parameters to be improved and explain what treatment train is needed 5. Calculate the dimensions of the wastewater treatment processes 6. Draw wastewater treatment schemes The course consists of 4 ECTS which means a study load of 112 hours. This is divided into: 42 hours classes (6 hours per week during 7 weeks) 42 hours preparation and self study 24 hours preparation on exams 4 hours exams	
Education Method	The theory is available in lecture notes/books, slides and collegerama on BrightSpace. The course is also available as Massive Online Open Course (MOOC) on the EdX platform. Oral lectures will highlight the most important aspects, together with exercises and exam preparation. One block lecture will consist of excursions. The course will be given on-campus or online (depending on situation)	
Course Relations	BSc course Water Management (in Dutch)	
Assessment	Online and On-campus assessment forms. The testing is done by two written partial exams. The first partial exam is done in week 5 and the second in week 8-10. The partial exams consist of 3 parts testing: - Knowledge - Calculations of water treatment processes - Drawing of treatment schemes 50% exam drinking water treatment 50% exam wastewater treatment The minimum mark for both partial exams is 5.0 for passing. Re-exam includes both partial exams. Partial marks will not be kept.	
Expected prior Knowledge	Introduction to Watermanagement, CTB2011	
Academic Skills	Critical analytical thinking, interpretation, problem solving	
Literature & Study Materials	Lecture notes. Down loadable from BrightSpace Book. Drinking water-principles and practices P.J.de Moel, J.Q.J.C. Verberk, J.C.van Dijk, World Science. Available at book stores and secretary sanitary engineering, room 4.55 Optional: Wastewater Engineering: MetCalf & Eddy: Treatment and Reuse. 4th ed. McGraw-Hill publ.

Collegerama	Yes	

CTB3390	Mechanics and Transport by Flow through Poreus Media	4
Responsible Instructor	S. Muraro	
Course Coordinator	S. Muraro	
Contact Hours / Week x/x/x/x	0/0/4/0	
Education Period	3	
Start Education	3	
Exam Period	3 4	
Course Language	English	
Course Contents	This course is jointly given with AESB3340. In this course, students acquire a fundamental basis for one- and two-phase flow in porous media. This course is an essential basis for all tracks within the MSc Applied Earth Sciences as well as the MSc track Geo-engineering in the MSc Civil Engineering. This course is highly recommended for students interested in Hydraulic Engineering as well as Hydro-geology and Water Management. The course will address the following topics: - basic principles for groundwater flow under saturated conditions (1D, 2D and 3D, both stationary as well as non-stationary flow); - (potential) energy and its relationship with pressure and head; - capillary pressure and unsaturated flow (2 phase flow in a porous medium filled with water and air); - concepts of water and air content, saturation, hydraulic conductivity, relative permeability and residual saturation; - water retention curves (van Genuchten, Brooks-Corey, and Gardner equations); - the impact of flow and transport on soil mechanics, highlighting the connection with the parallel course of soil mechanics.	
Study Goals	At the end of this course you will be able to: - explain the origins of groundwater flow; - derive the governing equations of the groundwater flow with appropriate initial and boundary conditions for saturated soils and unsaturated soils; - solve laboratory and field steady-state and transient problems for saturated (1D, 2D) and unsaturated (1D) flow by programming a Python/Matlab script; - discuss the quality and the limitations of the model results.	
Education Method	The course is structured along weekly lectures and e-tivities (so-called online activities). The aim of this structure is to provide students with valuable feedback of their progress. The content is structured with a study guide which is based on topics discussed in a number of standard handbooks. - Self-study The key to passing this course is self-study. The heart of the course is a study guide. In this guide all topics are specified in based on assignments which the students are required to make. The study guide points to the relevant chapters and paragraphs in a number of handbooks which the students need to study in order to be able to solve the assignments. There are several very good reference books available that cover the content of this course. - Lectures The study guide describes the content of each lecture and the students are expected to prepare for each lecture by making assignments and reading the required background material. The course is organised along so-called e-tivities, activities integrated in Brightspace. These e-tivities are a series of test assignments with which the students can evaluate their progress themselves. Students are expected to upload questions to Brightspace about the assigned work or any subjects they have difficulties with. During the lectures these questions will be addressed. The lectures will be interactive and led by student questions and student feedback. A limited set of (the most difficult) theoretical concepts will be explained during the lectures, students are expected to study the remainder themselves. - Asynchronous feedback and dialog Using the Discussion Board on Brightspace environment, students are expected to collaborate in order to identify questions and to help each other complete the assignments. These tools are also used to give and get feedback on intermediate results (i.e. the assignments) but also on lectures etc. --- ONLINE TEACHING IN CASE OF COVID-19 measures --- In the case of COVID-19 restrictions to on-campus lectures, the course will be given online as in 2021.	
Course Relations	This course is closely related with Soil Mechanics (CTB2310) and Physical Transport Phenomena (AESB2320). The course is fundamental to the Geo-engineering field and integrates different aspects with respect to the flow of water through porous media.	
Literature and Study Materials	Study guide, lecture notes, material on Brightspace, links to several good handbooks.	
Assessment	Final exam in week 10. The exam consists of a series of questions that are similar to the assignments prepared for and discussed during the lectures. The online activities given during the course are compulsory activities and enter in the final summative assessment (after the final exam is passed). The final grade is calculated as: 70% exam + 30% Online Activities --- ONLINE FINAL EXAM IN CASE OF COVID-19 measures --- In the case of COVID-19 restrictions to on-campus exam, the exam will consist of online assignments in Brightspace. Each set of questions will open at a specific time and will close at a specific time. The exam is open book and consists of open-ended questions. Multiple versions of the exam questions will be used. Answers to the questions need to be uploaded to Brightspace as word or pdf files. A random selection of students will be contacted for a short oral check related to their exams.	
Permitted Materials during Tests	No intermediate tests will be given.	
Contact	Dr. Stefano Muraro Email S.Muraro@tudelft.nl Phone +31 15 27 83327	
Expected prior Knowledge	All Math, Mechanics 1, Soil Mechanics	
Academic Skills	Knowledge, students: - know the concepts and assumptions which form the basis of Darcy's Law; - are able to apply Darcy's law in a range of different applications;	

	- understand how to simplify the 3D flow equation to 2D or 1D; - are able to explain when the assumptions used in the reduction of dimensionality are applicable; - understand the concepts of capillary pressure and unsaturated flow; - understand and be able to use the van Genuchten, Brooks-Corey, and Gardner equations; Skills, students: - are able to derive quantitative solutions to a range of engineering problems using analytical solutions; - have developed skills to share information and knowledge in an online environment; - have developed skills to help others in an online environment; - have developed the skill to use Python/Matlab to assess simple numerical and analytical solutions to flow and transport problems; - will have the skill to integrate transport of solutes with the groundwater flow problems in order to analyse groundwater contamination problems; Attitude, students: - will have developed an appreciation of the intrinsic value of the sub-surface for society, ecosystem etc. - will have developed an open attitude for collaboration in an online environment. Literature & Study Materials All course materials are given on the Brightspace site. The course is based on the following books: Groundwater Science, 2013, Charles R. Fitts, second edition, Academic Press, Elsevier. Unsaturated Soil Mechanics, 2004, Lu, Ning; Likos, William J., John Wiley & Sons: Chapters 2, 3, 4, 8, 9. You are strongly advised to buy the book by Fitts. For Lu and Likos, we only use a small number of chapters. Printed copies of downloads will suffice. Judgement For more information on grading, see article 14 in the Rules and Guidelines (RGBE): https://www.tudelft.nl/en/student/ceg-student-portal/education/education-information/educational-rules-and-regulations Permitted Materials during Exam ON-CAMPUS FINAL EXAM The exam is an open book exam, the student is allowed to bring all books, lecture notes, and worked examples. The student is allowed to use an electronic calculator. No electronic media with wireless or network capabilities are allowed as the exam is an individual assessment and no collaboration is allowed. --- ONLINE FINAL EXAM IN CASE OF COVID-19 measures --- In the case of COVID-19 restrictions to on-campus exam, the exam will be online. The exam is an open book exam, the student is allowed to bring all books, lecture notes and worked examples. The students will use their laptops to solve the exam. Collegerama No

Expected prior knowledge	Concrete and Steel Structures Structural Mechanics I Structural Mechanics II Structural Mechanics III	
Parts	The course Concrete Structures 2 (CTB3335) contains two theoretical parts: Reinforced concrete. This part consists of the theories related to slab design (one way, two way spanning slabs and punching shear), crack width control, torsion design. Statically determinate prestressed girders. Design of prestressed concrete girders, prestress losses, capacity and detailing.	
Summary	This course is to give an introduction to the basic knowledge on how to design and assess the serviceability and safety of reinforced and statically determinate prestressed structures.	
Course Contents	Design of reinforced concrete members under torsion. Crack width calculation based on the tensile member model in both crack formation stage & stabilized cracking stage. Design of reinforced concrete slabs spanning in one and two directions. Including different calculation methods for the internal forces, such as elastic analysis and equilibrium method for slabs with beams and flat slabs. Punching shear resistance. Theory and application. Introduction about the differences in the design of reinforced concrete and prestressed concrete. Design of statically determinate prestressed concrete girders. Principles and materials, and prestressing as an external load. Prestress losses: friction, slip, creep, shrinkage, relaxation. Bending moment capacity, ultimate limit state. Detailing, introduction of prestressing forces.	
Study Goals	After completion of this course, students should be able to: Calculate the torsional capacity of a reinforced concrete member, and identify the design limit state when a torsion check necessary. Identify the different stage of cracking for a reinforced concrete structure, and calculate the crack width of a member under tension or bending. Determine cross-sections and rebar configurations of one way spanning slabs, two way spanning slabs and flat slabs, based on theory of elasticity or equilibrium method. Calculate the punching shear capacity of a flat slab, and decide the appropriate strengthening approach when the punching shear capacity is not sufficient. Determine cross-sections and tendon configurations of pre-stressed concrete girders and explain the influence of the design on internal forces and stresses. Calculate prestress losses. Calculate the capacity of prestressed concrete girders in ULS. Determine rebar configurations in the areas in which (prestressing) forces are introduced. This course is 4 ECTS, which corresponds to a study load of 112 hours. The presented study load is indicative and might vary based on the prior knowledge of the student. Lectures 28 hours Self-study 60 hours Preparation for the exam 21 hours Exam 3 hours	
Education Method	The education methods exist of lectures in combination with self-study. Furthermore, students can actively participate with elective, formative questions during the lecture series. --- UPDATE dd 2-2-2021 due to the COVID-19 measures --- The education methods consists of online, recorded collegerama lectures in combination with 2 hours long Q&A sessions held weekly by lecturers. Students can actively participate with elective, formative questions during the Q&A sessions.	
Course Relations	Concrete Structures 2 is used by: CIE4160 Prestressed Concrete and other Structural engineering courses such as CIE5130 Capita Selecta Concrete Structures.	
Literature and Study Materials	Reinforced concrete: Chapters 11, 14 and 15, namely Torsion, Slabs/punching shear and Crack width control (material is available on the Brightspace) Textbook Prestressed concrete (most recent version: 2019, available on the Brightspace) with following chapters: Chapters 1 to 4 inclusive. Chapter 6 sections 6.1, 6.2.1, 6.2.2, 6.5 and the example from 6.6.2. Chapter 7 sections 7.1 and 7.2. Chapter 10 sections 10 to 10.2.3 inclusive. Booklet examples from exams. Examples reinforced concrete. Example prestressed concrete.	
Assessment	The learning objectives will be assessed based on the exam, with criterion based grading. The course is finalized with a 3 hour written examination. --- UPDATE dd 2-2-2021 due to the COVID-19 measures --- The learning objectives will be assessed based on the online open-book exam, with criterion based grading. The course is finalized with a 2.5 hour written examination.	
Permitted Materials during Tests	Calculator as described by the examination regulations 1 - A4 with hand written notes (one side only).	
Expected prior Knowledge	Know how to draw a moment/shear diagram of beams with different boundary conditions; Understand the difference between Ultimate Limit State and Serviceability Limit State. Be able to design the cross section and reinforcement of a reinforced concrete beam for bending and shear. Have the basic knowledge of the material properties of concrete and steel.	
Academic Skills	Analysis, Application, Literature survey	
Literature & Study Materials	See above	
Judgement	See above

Exam Period	3 4	
Course Language	Dutch (on request English)	
Expected prior knowledge	Ontwerpen van constructies en funderingen Beton en staalconstructies	
Parts	-Workshops special aspects low rise structures -self study of reader and written test -design exercise and presentation	
Course Contents	The course consists of 10 modules: Introduction low rise Low rise steel Low rise in timber Low rise in prefab concrete Low rise in structural glass Floors and foundations Introduction housing Housing in situ Housing in masonry Housing in timber	
Study Goals	Demonstrate understanding of various aspects of low rise buildings and be able to design low rise building structures, with a specific focus on: Functional, structural and construction requirements for housing and industrial buildings Relationship between load bearing structure and finishing structure for roof, facade and ground floor for housing and industrial buildings Steel and concrete elements on intermediate level (know requirements related to transport, assemblage and maintenance, design and calculate of structures with some complexity, select suitable detail and construction options) Timber elements on introductory level (design and calculate simple structures, select suitable detail and construction options, understand thermal behaviour) Glass or masonry elements on introductory level (understand relevant material properties, apply relevant safety procedure, design and calculate simple structures, apply suitable detail options) Stability systems (braced and unbraced structures), with attention to second order forces (understand differences, calculate frameworks with second order effect) Foundations on intermediate level (understand various ways of foundations, be able to calculate stiffness of various foundations) Specific aspects of ground floors for industrial buildings and housing (know various types of ground floors with advantages and disadvantages, apply suitable measures to deal with cracking of concrete ground floors)	
Education Method	Workshops and design exercise	
Course Relations	Building Structures 2	
Literature and Study Materials	Reader Building structures 1, additional study material from workshops to be appointed.	
Assessment	The final grade is made up of a grade for the exam (50%) and a grade for the group assignment (50%). The minimum grade for each part is 5.0.	
Elective	Yes

Expected prior knowledge	basic fluid mechanics, ordinary and partial differential equations, complex numbers	
Parts	lectures MAPLE TA tests	
Course Contents	Shallow-water equations, preliminary analyses and classification of waves; Elementary wave equation, solution method and analyses; Translatory waves, interaction with control structures, tidal bore; Method of characteristics, sub- and super-critical flow, transients in closed conduits; Tidal basins, influence resistance and inertia, resonance; Harmonic method, Lorentz-linearisation, tidal propagation in large systems; High water waves, kinematic waves and diffusion model, hysteresis.	
Study Goals	After mastering the course the student should be able to identify, analyze and compute various wave phenomena encountered in hydraulic engineering and water management that are governed by the one-dimensional shallow water equations. This relies on selective schematization and choosing adequate solution strategies which involves: - understanding the role of the hydrostatic pressure approximation - classification and analyses of waves based on resistance versus inertia - understanding the basic structure of elementary wave solutions - addressing initial and boundary conditions, (partial) reflection - graphical construction of solutions using the method of characteristics - analyses of small basins with discrete storage, resistance and inertia - analyses of traveling and standing waves in large basins including resistance - analyses of high water waves with dominant resistance, kinematic waves, diffusion model	
Education Method	lectures MAPLE TA tests (homework)	
Course Relations	fluid mechanics, dynamics, calculus, water management, hydraulic structures, computational modeling of flow and transport	
Literature and Study Materials	Textbook "Unsteady Flow in Open Channels", Jurjen Battjes and Robert Jan Labeur, Cambridge University Press, ed. 2017; available through VSSD, amazon.com, bol.com Available on BrightSpace: - lecture slides - answers to problem sets - compilation of assignments - various MatLab scripts and videos	
Assessment	written exam (summative) online MapleTA tests for self assessment (not compulsory)	
Permitted Materials during Tests	pen, pencils, ruler, eraser (graphical) non-programmable calculator as described in the examination regulations.

Contact Hours / Week x/x/x/x	0/0/6/0	
Education Period	3	
Start Education	3	
Exam Period	3 4	
Course Language	English	
Summary	The course enables students to produce a conceptual design of the common hydraulic engineering structures, with help of good quality sketches and hand calculations, taking the constructability of these structures into account.	
Course Contents	The focus of this course is on hydraulic structures, e.g. bridge piers, quays & jetties, construction pits, storm surge barriers, dams, locks/sluices, immersed and bored tunnels, etc. The students are taught to make a conceptual engineering design according to the systems engineering method. The design objective leads to a functional-spatial design, which is followed by a structural design where next to stability and strength checks, constructability plays a major role. The student learns to motivate assumptions, methods and values of design parameters, using basic sketches.	
Study Goals	1. produce a conceptual design of the common hydraulic engineering structures; 2. describe, in sufficient detail, a feasible construction method for the structure being designed; 3. prepare the necessary sketches or drawings, 2D or 3D, for a conceptual design; 4. do the required hand calculations for conceptual design and indicate for which items more sophisticated computational means have to be used	
Education Method	Lectures: During the lectures, hydraulic structures and the construction methods available for these structures are explained. The lectures are closely related to the design exercise. Construction Methods Exercise (CME): For the Construction Methods Exercise, about 40 to 50 construction activities have to be put in the right order, depending on the type of structure and information on local conditions that will be provided. Work on the Construction Methods Exercise has to start in the first week of the lecture period. The exercise has to be finished and submitted in the beginning of the 2nd teaching week of Q3. Although not for a grade, the exercise will be checked. In case of fundamental errors in the proposed construction method, some extra work needs to be done on the CME in the 2nd or 3rd teaching week of Q3. Work on the CME needs to be completed before being allowed to start the design exercise (DEHS). Design Exercise Hydraulic Structures (DEHS): The Design Exercise Hydraulic Structures (DEHS) aims at making a conceptual design of a hydraulic structure, including sketches and/or drawings of typical cross-sections of a hydraulic structure, several hand calculations regarding key design issues (e.g. stability, strength and stiffness, type of foundation) and a description of the construction method for the structure. The student should motivate assumptions and the choice of methods needed to determine the main dimensions and functionality. The exercise is divided into six phases, starting in week 2 and ending at the start of week 8 of Q3. After every phase, the work of the student will be checked for a grade, that will be part of the final course grade. During a questions & answers session, students have the opportunity to get guidance when making the design exercise. The discussion forum on Brightspace is available as well for questions.	
Course Relations	Pre-knowledge of BSc. courses that either have to be completed or studied sufficiently before taking the course Hydraulic Structures 1: CTB2110 Vloeistofmechanica - Fluid Mechanics CTB2210 Constructiemechanica - Structural Mechanics CTB2220 Beton & Staalconstructies - Concrete&Steel Structures CTB2310 Grondmechanica - Soil Mechanics CTB2320 Ontwerpen van Constructies & Funderingen 2 - Design of Structures & Foundations 2 CTB2410 Waterbouwkunde - Hydraulic Engineering MSc. courses depending on Hydraulic Structures 1: CIE5313 Hydraulic Structures II - Storm surge barriers, Quays CIE5305 Bored & Immersed Tunneling CIE5304 Water Power Engineering CIE5314 Flood Defences	
Literature and Study Materials		
Assessment	The construction method exercise (CME), and the design exercise (DEHS) are compulsory. Construction Method Exercise (CME): The individual work on the Construction Methods Exercise has to be completed with a sufficient result before being allowed to do the design exercise (DEHS). The CME is not graded for the final course grade. Design Exercise Hydraulic Structures (DEHS): All six phases of the design exercise are graded. Phases 1-4 will be done and graded in pairs of two students, the phases 5 and 6 are done and graded individually. How to pass the course: You must have a pass for CME. For each DEHS-phase, you will receive a partial grade. A phase with a partial grade higher than 4,0 can be repaired (highest grade then is a 6,0). If a phase is graded with 4,0 or lower, the student is not longer allowed to continue the course in the same quarter. The final grade is composed by the partial grades for the DEHS phases 1 to 6, where the grades for the last two phases have a double weight compared to the first four phases. The final grade is at least 6.0. Failed CME-exercises and DEHS-phases graded lower than 5,0 can be redone in the same Q3. If you do not pass the course in Q3, you can redo the entire course in Q4.	
Permitted Materials during Tests	While working on the exercises any (information) material of use can/should be used.	
Expected prior Knowledge	CTB2110 Vloeistofmechanica - Fluid Mechanics CTB2210 Constructiemechanica - Structural Mechanics CTB2220 Beton & Staalconstructies - Concrete&Steel Structures CTB2310 Grondmechanica - Soil Mechanics	

	CTB2320 Ontwerpen van Constructies & Funderingen 2 - Design of Structures & Foundations 2 CTB2410 Waterbouwkunde - Hydraulic Engineering
Academic Skills	If basic knowledge of the courses is not, or only partly, present, the course will take more time than the nominal 4 EC. The student knows when and how to apply scientific theories and practical methods in a hydraulic engineering design. The student judges what level of detail is required for the type of design at hand. The student can deal with methods that are not entirely suitable for the present problem, and with the lack of sufficiently detailed or accurate data.
Literature & Study Materials	The following lecture notes are obligatory and are available in hard copy as well as in pdf: Hydraulic Structures - General lecture notes Hydraulic Structures - Manual Hydraulic Structures - Locks Hydraulic Structures - Caissons Check Brightspace, for handouts of the lectures and other relevant material.
Judgement	For more information on grading, see article 14 in the Rules and Guidelines (RGE): https://www.tudelft.nl/en/student/ceg-student-portal/education/education-information/educational-rules-and-regulations
Permitted Materials during Exam	While working on the exercises any (information) material of use can/should be used.

CTB3370-18	Geometrical Design of Roads and Railways	4
Responsible Instructor	Dr.ir. H. Farah	
Instructor	Dr.ir. A.M. Salomons	
Contact Hours / Week x/x/x/x	0.0.10.0	
Education Period	3	
Start Education	3	
Exam Period	3 4	
Course Language	English	
Course Contents	Geometric design of roads and railways: Cross sections, horizontal and vertical alignment, integration of the horizontal and vertical alignments; Intersection design, roundabouts and turbo-roundabouts, interchanges, discontinuities; Design for pedestrians and cyclists; Railroad categories, and characteristic of railroad traffic; Functional design of railway-infrastructure; Design of trams in urban areas; Human factors and road systems design; Using AutoCAD and Civil3D;	
Study Goals	At the end of this course you will be able to: Apply design guidelines and design methodologies for designing the geometric alignment of roads and railways. Explain the relationship between road design and road user behaviour. Interpret and analyse characteristics of railway infrastructure elements. Design railways and tram lines. Display roads and railways design using AutoCAD and Civil3D. Evaluate the implications of different design alternatives on road user behaviour, traffic safety and traffic operation. Think critically and make design decisions.	
Education Method	The course Geometric Design of Roads and Railways is taught in lectures and practicum. The lectures explain the theory and principles of roads and railways design, and provide knowledge and insights on the fundamental issues in design. In the practicum (lab hours), students develop skills to apply this knowledge on real projects of designing roads and railways. The practicum is also meant to increase the understanding of the subject and to prepare the students for the assessment.	
Assessment	The assessment in this course is composed of the assessment of the two projects and the written examination (digital examination via ANS) as following: o 35% First project (a minimum score of 5.0 is required) o 25% Second project (a minimum score of 5.0 is required) o 40% Written examination (a minimum score of 5.0 is required)	
Expected prior Knowledge	CTB1420 - Transport & Planning	
Academic Skills	- Problem solving - Critical thinking - Design - Reasoning - Writing skills - Presentation skills	
Literature & Study Materials	The following books and guidelines can be referred to: Traffic & Highway Engineering, Fifth Edition, N.J. Garber, L.A. Hoel, 2009, CENGAGE Learning. Designing Safe Road Systems: A Human Factors Perspective (Human Factors in Road and Rail Transport) by Jan Theeuwes, Richard Van Der Horst and Maria Kuiken (Aug 28, 2012). NCHRP Report 600, Human Factors Guidelines for Road Systems, Second Edition, 2012. Behavioural Adaptation and Road Safety: Theory, Evidence and Action by Christina Rudin-Brown and Samantha Jamson (May 24, 2013). Modern Railway Track, Version 3.4, Coenraad Esveld, 2014. ROA, Richtlijn Ontwerp Autosnelwegen 2019, Rijkswaterstaat, 2019 (The Dutch design guidelines for motorways). CROW Handboek Wegontwerp (NL), (available from CROW kennisbank). ASVV-Dutch guidelines in urban areas (NL), (available from CROW kennisbank). CROW, Design manual for bicycle traffic (EN), June 2007. CROW, Road safety manual (EN), May 2009. Besides these references, specific material will also be provided during the lectures.	
Judgement	For more information on grading, see article 14 in the Rules and Guidelines (RGBE): https://www.tudelft.nl/en/student/ceg-student-portal/education/education-information/educational-rules-and-regulations	
Permitted Materials during Exam	No material is allowed during the exam.	
Collegerama	No	

CTB3385	Use of Underground Space	4
Responsible Instructor	Dr.ir. W. Broere	
Contact Hours / Week x/x/x/x	0/0/4/0	
Education Period	3	
Start Education	3	
Exam Period	3 4	
Course Language	English	
Expected prior knowledge	The course is open to students from other faculties and has no prerequisite courses. It is advisable to previously follow the courses Soil Mechanics and Design of Structures and Foundations.	
Summary	Students obtain basic knowledge of the multidisciplinary aspects of the use of underground space.	
Course Contents	Introduction and overview of the course Geotechnical engineering (introduction) Installation techniques and soil improvement methods Legal aspects Subsurface planning Decision making process Resilience & sustainability aspects Basics of various kinds of tunnels Small infrastructure Basements Tunnel cross sections & modalities Safety and risk management Social safety Mixed use of land, layered use of land New developments in construction techniques Case 1 (actual project) Case 2 (actual project)	
Study Goals	explain characteristics of several construction technologies. assess the construction technologies in different situations, with different geological or physical conditions. analyse and structure the complex decision making process related to the use of underground space. define an integral approach related to the use of underground space Study load. Lectures 14 x 2 hours: 28 hours Hours related to lectures: 14 hours Self-study (syllabus/sheets:) 25 hours Paper: 35 hours Exam preparation: 12 hours Exam: 2 hour Total 116 hours	
Education Method	Lectures, open book written exam, writing a paper (group wise, minimum 2 maximum 4 students)	
Literature and Study Materials	For the course, students can make use of the syllabus Use of Underground Space (190 pages) and the sheets of the lectures which are made available on BS. It is recommended but not compulsory that students also read the book Ondergronds bouwen (255 pages) COB (ISBN 90 807297 1 X).	
Assessment	After the lectures students have to form groups consisting of two (minimum) to four (maximum) students and write a short paper (approx. 20 pages) about a topic than can either be chosen from a list of available topics or their own choice, and agreed upon by the lecturers. The topic has to be related to the use of underground space. After the paper is finished a group wise mark is given for the paper, based on the coherence of the paper and the understanding and ability to apply the relevant information from the lectures, literature and syllabi. A (computerized) written exam is taken individually. The final mark is based on: 50% paper, 50% written exam.	
Permitted Materials during Tests	None	
Contact	The student-assistants of Underground Space Technology can be contacted at E: StudassOGB-CiTG@tudelft.nl T: 85256	
Expected prior Knowledge	The course is open to students from other faculties and has no prerequisite courses. It is advisable to previously follow the courses Soil Mechanics and Design of Structures and Foundations.	
Academic Skills	Knowledge on use of underground space, problem analysis, evaluation, literature review, scientific writing and reporting	
Literature & Study Materials	For the course, students can make use of the syllabus Use of Underground Space (190 pages) and the sheets of the lectures which are made available on BS. It is recommended but not compulsory that students also read the book Ondergronds bouwen (255 pages) COB (ISBN 90 807297 1 X).	
Judgement	For more information on grading, see article 14 in the Rules and Guidelines (RGE): https://www.tudelft.nl/en/student/ceg-student-portal/education/education-information/educational-rules-and-regulations	
Permitted Materials during Exam	None	
Collegerama	No	

CTB3390	Mechanics and Transport by Flow through Poreus Media	4
Responsible Instructor	S. Muraro	
Course Coordinator	S. Muraro	
Contact Hours / Week x/x/x/x	0/0/4/0	
Education Period	3	
Start Education	3	
Exam Period	3 4	
Course Language	English	
Course Contents	This course is jointly given with AESB3340. In this course, students acquire a fundamental basis for one- and two-phase flow in porous media. This course is an essential basis for all tracks within the MSc Applied Earth Sciences as well as the MSc track Geo-engineering in the MSc Civil Engineering. This course is highly recommended for students interested in Hydraulic Engineering as well as Hydro-geology and Water Management. The course will address the following topics: - basic principles for groundwater flow under saturated conditions (1D, 2D and 3D, both stationary as well as non-stationary flow); - (potential) energy and its relationship with pressure and head; - capillary pressure and unsaturated flow (2 phase flow in a porous medium filled with water and air); - concepts of water and air content, saturation, hydraulic conductivity, relative permeability and residual saturation; - water retention curves (van Genuchten, Brooks-Corey, and Gardner equations); - the impact of flow and transport on soil mechanics, highlighting the connection with the parallel course of soil mechanics.	
Study Goals	At the end of this course you will be able to: - explain the origins of groundwater flow; - derive the governing equations of the groundwater flow with appropriate initial and boundary conditions for saturated soils and unsaturated soils; - solve laboratory and field steady-state and transient problems for saturated (1D, 2D) and unsaturated (1D) flow by programming a Python/Matlab script; - discuss the quality and the limitations of the model results.	
Education Method	The course is structured along weekly lectures and e-tivities (so-called online activities). The aim of this structure is to provide students with valuable feedback of their progress. The content is structured with a study guide which is based on topics discussed in a number of standard handbooks. - Self-study The key to passing this course is self-study. The heart of the course is a study guide. In this guide all topics are specified in based on assignments which the students are required to make. The study guide points to the relevant chapters and paragraphs in a number of handbooks which the students need to study in order to be able to solve the assignments. There are several very good reference books available that cover the content of this course. - Lectures The study guide describes the content of each lecture and the students are expected to prepare for each lecture by making assignments and reading the required background material. The course is organised along so-called e-tivities, activities integrated in Brightspace. These e-tivities are a series of test assignments with which the students can evaluate their progress themselves. Students are expected to upload questions to Brightspace about the assigned work or any subjects they have difficulties with. During the lectures these questions will be addressed. The lectures will be interactive and led by student questions and student feedback. A limited set of (the most difficult) theoretical concepts will be explained during the lectures, students are expected to study the remainder themselves. - Asynchronous feedback and dialog Using the Discussion Board on Brightspace environment, students are expected to collaborate in order to identify questions and to help each other complete the assignments. These tools are also used to give and get feedback on intermediate results (i.e. the assignments) but also on lectures etc. --- ONLINE TEACHING IN CASE OF COVID-19 measures --- In the case of COVID-19 restrictions to on-campus lectures, the course will be given online as in 2021.	
Course Relations	This course is closely related with Soil Mechanics (CTB2310) and Physical Transport Phenomena (AESB2320). The course is fundamental to the Geo-engineering field and integrates different aspects with respect to the flow of water through porous media.	
Literature and Study Materials	Study guide, lecture notes, material on Brightspace, links to several good handbooks.	
Assessment	Final exam in week 10. The exam consists of a series of questions that are similar to the assignments prepared for and discussed during the lectures. The online activities given during the course are compulsory activities and enter in the final summative assessment (after the final exam is passed). The final grade is calculated as: 70% exam + 30% Online Activities --- ONLINE FINAL EXAM IN CASE OF COVID-19 measures --- In the case of COVID-19 restrictions to on-campus exam, the exam will consist of online assignments in Brightspace. Each set of questions will open at a specific time and will close at a specific time. The exam is open book and consists of open-ended questions. Multiple versions of the exam questions will be used. Answers to the questions need to be uploaded to Brightspace as word or pdf files. A random selection of students will be contacted for a short oral check related to their exams.	
Permitted Materials during Tests	No intermediate tests will be given.	
Contact	Dr. Stefano Muraro Email S.Muraro@tudelft.nl Phone +31 15 27 83327	
Expected prior Knowledge	All Math, Mechanics 1, Soil Mechanics	
Academic Skills	Knowledge, students: - know the concepts and assumptions which form the basis of Darcy's Law; - are able to apply Darcy's law in a range of different applications;	

	- understand how to simplify the 3D flow equation to 2D or 1D; - are able to explain when the assumptions used in the reduction of dimensionality are applicable; - understand the concepts of capillary pressure and unsaturated flow; - understand and be able to use the van Genuchten, Brooks-Corey, and Gardner equations; Skills, students: - are able to derive quantitative solutions to a range of engineering problems using analytical solutions; - have developed skills to share information and knowledge in an online environment; - have developed skills to help others in an online environment; - have developed the skill to use Python/Matlab to assess simple numerical and analytical solutions to flow and transport problems; - will have the skill to integrate transport of solutes with the groundwater flow problems in order to analyse groundwater contamination problems; Attitude, students: - will have developed an appreciation of the intrinsic value of the sub-surface for society, ecosystem etc. - will have developed an open attitude for collaboration in an online environment.
Literature & Study Materials	All course materials are given on the Brightspace site. The course is based on the following books: Groundwater Science, 2013, Charles R. Fitts, second edition, Academic Press, Elsevier. Unsaturated Soil Mechanics, 2004, Lu, Ning; Likos, William J., John Wiley & Sons: Chapters 2, 3, 4, 8, 9.
Judgement	You are strongly advised to buy the book by Fitts. For Lu and Likos, we only use a small number of chapters. Printed copies of downloads will suffice. For more information on grading, see article 14 in the Rules and Guidelines (RGE): https://www.tudelft.nl/en/student/ceg-student-portal/education/education-information/educational-rules-and-regulations
Permitted Materials during Exam	ON-CAMPUS FINAL EXAM The exam is an open book exam, the student is allowed to bring all books, lecture notes, and worked examples. The student is allowed to use an electronic calculator. No electronic media with wireless or network capabilities are allowed as the exam is an individual assessment and no collaboration is allowed. --- ONLINE FINAL EXAM IN CASE OF COVID-19 measures --- In the case of COVID-19 restrictions to on-campus exam, the exam will be online. The exam is an open book exam, the student is allowed to bring all books, lecture notes and worked examples. The students will use their laptops to solve the exam.

CTB3420	Integral Design of Infrastructure	4
Responsible Instructor	Prof.dr.ir. M.J.C.M. Hertogh	
Responsible Instructor	Dr.ir. G.A. van Nederveen	
Contact Hours / Week x/x/x/x	0/0/0/6 Hoorcollege 2 uur per week Project: groepswork, 4 u/w begeleid	
Education Period	4	
Start Education	4	
Exam Period	none	
Course Language	English	
Parts	- Develop and execute a project plan; - Make a project analysis, including problem analysis, site analysis and stakeholder analysis and definition of the project scope; - Develop a design proposal; go through the full design cycle for a given case; - Realize the integration of the different engineering disciplines; - Elaborate specific parts or aspects; - Oral and written presentation of the design proposal.	
Summary	Integration and application of different civil engineering disciplines in a design project setting.	
Course Contents	Infrastructure projects are characterized by the complex setting in which they take place and the broad spectrum of involved technical disciplines: road, rail, structures, water, ground, etc. In other words: this kind of projects are multi-disciplinary and integral by definition. The planning and design process are executed in groups using a case assignment from practice. Systems engineering is an important method in this course. Subjects: - Project management, - Design approaches, - Structural engineering, - Systems engineering, - Economic and social aspects, sustainability, use and environment. - Risk management.	
Study Goals	- Develop and execute a project plan; - Develop a design proposal; go through the full design cycle for a given case; - Realize the integration of the different engineering disciplines; - Elaborate specific parts or aspects; - Oral and written presentation of the design proposal.	
Education Method	Project course with supporting lectures	
Course Relations	This course builds upon first year course CTB 1220 "Integraal Ontwerp en Beheer" and more generally upon knowledge gained in the first and second year of the Bachelor CT. This course uses and is relevant for all civil engineering disciplines.	
Literature and Study Materials	Will be made available through BrightSpace	
Assessment	Group reports (project plan, project analysis, design documents, final report), group presentations, and individual reports are assessed.	
Expected prior Knowledge	Third year BSc Civil Engineering	
Academic Skills	Collaboration in teams, presenting, reporting, information skills, awareness of societal impact of infrastructure projects	
Literature & Study Materials	Will be made available through Brightspace	
Judgement	For more information on grading, see article 14 in the Rules and Guidelines (RGE): https://www.tudelft.nl/en/student/ceg-student-portal/education/education-information/educational-rules-and-regulations

Instructor	Drs.ir. R.E.P. de Nijs	
Instructor	Ir. F.J. van Leijen	
Contact Hours / Week x/x/x/x	0/0/0/4 20 lecture hours 12 tutorial hours and 1 day excursion	
Education Period	4	
Start Education	4	
Exam Period	4 5	
Course Language	English	
Parts	Lectures for principles and methodology Tutorials for data elaboration and assessment of dikes and embankments Analysis of a case history	
Summary	The general learning goal of this course is to study basic geotechnical and geodetic aspects related to dikes and embankments, with special emphasis on monitoring and assessment of the stability and settlements. These skills should be applicable in a more general sense to the design, analysis, model, interpretation and visualisation in relation to geotechnical and geodetic problems.	
Course Contents	Soil mechanics topics for dikes and embankments: Soils as construction materials. Volumetric behaviour of the soils; i.e. consolidation and creep, Soil shear strength, Seepage and free surface flow. Construction and lifetime behaviour: Generation and dissipation of pore pressures. Settlements and deformation. Geomechanical analysis of deformation. Influence of pore water pressure. Geotechnical monitoring: Measurement of displacements, pore pressure, water content. Design of a monitoring system for dikes, embankments and subsoil. Data elaboration and interpretation. Static 3D object reconstruction: Observation technologies for geometry Relevant estimation theory. Modelling 3D objects. Working with large data volumes. Visualisation in 3D. Dynamic 3D: Observation of deformation. Remote Sensing techniques, time series analysis, monitoring in (near) real-time. Observation and estimation theory: Aspects related to 3D dikes and embankments. Thresholds and approaches for critical situations.	
Study Goals	At the end of this course you will be able to: 1. list possible failure mechanisms of dikes and embankments and list their early indicators of possible failure. 2. list the most important parameters to assess the stability of dikes and embankments. 3. list and describe the element classes of visual inspection and provide a list of examples. 4. describe the measurement principle, the error sources and the precision of different monitoring techniques. 5. explain the geotechnical processes (consolidation, groundwater flow and instability) occurring in/under the dikes and embankments and apply corresponding models for assessment and predictions. 6. carry out and assess a visual inspection of a dike. 7. process various remote sensing and in-situ monitoring measurements, estimate optimal models, and interpret the results. 8. process and analyze geotechnical and geodetic data in relation to deformation and stability, including quality assessment and control. 9. assess displacements and stability of dikes and embankments subjected to hydro-mechanical loads. 10. evaluate and summarize the results of observational data. design an optimal monitoring strategy for a certain situation, for instance the long-term monitoring of an embankment or a status check of a dike.	
Education Method	Lectures, tutorials, self-study, written reporting	
Course Relations	Soil Mechanics Survey and Mapping	
Assessment	Final mark = final written online examination grade (60%) + evaluation of final report (40%)	
Expected prior Knowledge	Soil Mechanics, Mathematics, knowledge of the concept of stress and strain as well as elasticity.	
Academic Skills	Critical thinking, Online learning, Note making, Time management, application of theory for problems, Basic mathematical skills	
Literature & Study Materials	Course book: Soil Mechanics, A. Verruijt, Delft University of Technology, 2012. Go to: http://geo.verruijt.net/ and download the book (in English) stored as SoilMechBook2012.pdf Accompanying lectures notes (in the form of pdf). Worked examples Lecture slides	
Judgement	For more information on grading, see article 14 in the Rules and Guidelines (RGBE): https://www.tudelft.nl/en/student/ceg-student-portal/education/education-information/educational-rules-and-regulations	
Permitted Materials during Exam	Calculator (see exam regulations for the allowed models)
