| <b>Expected prior knowledge</b>        | Some background in solid-state physics is helpful, for instance the lecture courses on Solid-State Physics (EE4705).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |   |
| <b>Course Contents</b>                 | <p>In this lecture first the movement of charge carriers in doped semiconductors under the influence of generation, recombination, drift, and diffusion is discussed. This knowledge is applied to p-n junctions. The current through this junction can be described well by the drift-diffusion model. For a metal-semiconductor junction the model describing the current-voltage relation ship is based the thermionic emission.</p> <p>The p-n junction is the base for the bipolar transistor. In the bipolar junction transistor (BJT) the reverse current of one p-n junction (the base-collector junction) is controlled by the injection of charge carriers from a forward biased p-n junction (the emitter-base junction). Some characteristics, like the Early effect and current crowding, are discussed.</p> <p>Also another transistor, the MOSFET, is discussed. This device is based on a MOS capacitor to which we will pay attention first. In this transistor the current is led via the source contact through a conductive channel in a semiconductor to the drain contact. The conductivity of the channel can be controlled by changing the bias on the gate contact. Characteristic for this device is that the current-voltage relationship is more linear in contrast to the bipolar transistor where it is exponential.</p> <p>Following the discussion on ideal MOSFETs, we will then focus on non-ideal characteristics of MOSFETs, like channel-length modulation and short-channel effects. Additionally, we will also pay attention to threshold voltage modification by varying the dopant concentration and MOS scaling.</p> <p>Finally, we will pay attention to power devices, like power MOSFETs, thyristors, and insulated-gate bipolar transistors (IGBT).</p> |   |
| <b>Study Goals</b>                     | <p>This course aims at a thorough understanding of the physics of semiconductor devices. Students are expected to be able to explain the operation of these devices based on their design and on the material properties. In addition, they should be able to derive mathematically the most important device characteristics, based on the physics of the device.</p> <p>The above description leads to the following learning objectives (LO) for this course:</p> <p>LO1: Describe processes in the semiconductor devices (p-n junction, BJT, metal-semiconductor junction, MOSFET, and power devices).</p> <p>LO2: Derive the current-voltage characteristics of these semiconductor devices, and understand and analyze these characteristics in relation to the device design.</p> <p>LO3: Being able to draw band diagrams, and understand the relations between these band diagrams on one hand and charge-carrier concentrations and device characteristics on the other hand.</p> <p>LO4: Understand and be able to construct the equivalent diagram of the above-mentioned semiconductor devices.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |   |

| <b>Literature and Study Materials</b>  | Donald A. Neamen: Semiconductor Physics and Devices, basic principles, McGraw Hill, 2012, 4th edition, ISBN 978-007-108902-9.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |   |
| <b>Assessment</b>                      | <p>The assessment is based on a written examination (100%).</p> <p>Exam admission conditions:<br/>Access to the examination is only possible if sufficient instruction questions have been prepared, as will be explained below. This procedure, called student-led tutoring, works as follows:</p> <p>*Before each of the 7 instruction sessions students are asked to indicate which of the 4 questions they will prepare by putting a tick in relevant section of Brightspace environment for this course.</p> <p>* At the instruction sessions students will be randomly picked to explain one of the questions they ticked (and consciously prepared) to the other students and the moderator.</p> <p>* At the end of each session, all exercises that have been ticked by at least one student have been discussed and the correct answers have been presented.</p> <p>* Students will need to have prepared at least 16 out of 28 questions (i.e., 57% of all questions; this is equivalent to 4 full instruction sessions) in order to get access to the written exam and, if needed, the resit exam.</p> <p>Repair option:<br/>If students have not managed to prepare at least 16 questions, a repair option is available in Week 8 of the quarter in which an extra instruction session with 4 questions will be organized. The latter implies that students who have ticked less than 12 questions (i.e., less than 43% of all questions) will not be admitted to the exams.</p> <p>Disclaimer: information may change depending on unforeseen circumstances or measures (see: TER Art 2, sub 5).</p>                                                                                                                                                                                     |   |

| <b>Course Language</b>                 | English                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |   |
| <b>Course Contents</b>                 | <p>The course is a follow-up of PV Technologies. Details of processing and characterization techniques of PV absorber materials and the solar cells functional coating will be discussed. Examples of lecture topics are advanced light management structures, novel surface passivating layers and contacting schemes. Background of deposition technologies such as Chemical Vapor Deposition (CVD), Physical Vapor Deposition (PVD) and Atomic Layer Deposition (ALD) will be given. Furthermore, working principles of special coatings and its functionality when applied to different solar cell concepts, including tandem devices, will be presented.</p> <p>This course is an elective one following the solar profile. PV Basics and PV Technologies should have been concluded successfully.</p>                              |   |
| <b>Study Goals</b>                     | <p>After this course students are able to understand processing mechanisms, material properties, and functionality and working principle of the novel functional coating applied to different solar cell concepts. Students are expected to be able to explain these working principles and have a solid background on different deposition technologies and characterization techniques, and will be able to describe the effect on the solar cells output. Students will be able to analyse and evaluate recent technology developments and the background of it, and summarize them during an oral presentation for the entire group.</p> <p>As we can see, these learning objectives are specific about the content, and they are phrased in terms of observable behaviour: understand, explain, evaluate, present and describe.</p> |   |
| <b>Education Method</b>                | <p>This course consists of eight 2-hour lectures. In the same week a 2 hour work session / instruction will be organized for a deeper understanding of the technologies discussed in the lectures. During the whole course the students will work on assignments which need to be submitted as reports. All assignments/reports should be assessed as sufficiently good (no specific mark). In week 9 (final schedule will be given at the beginning of the course) you will present results of a literature study on a special topic covered by the course for the entire group.</p>                                                                                                                                                                                                                                                    |   |
| <b>Literature and Study Materials</b>  | <p>Book (not obligatory, expensive): Photovoltaic Solar Energy: from fundamentals to applications by Angèle Reinders et al.</p> <p>Material from online course: PVCDROM, PV-manufacturing.org</p> <p>Slides during lectures</p> <p>Articles (referred to in lectures)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |   |
| <b>Assessment</b>                      | <p>The final grade consists of the following parts:<br/> presentation (team work) (50% of final grade);<br/> written exam (individual) (50%);<br/> Both marks will be expressed on a scale of 1 to 10 and should be 5.80 or higher.<br/> Reports on the assignments shall be completed as well, and assessed as sufficiently good (no specific mark).</p> <p>In case of an insufficient final result, repair options may exist in accordance with Article 17A Times and number of examinations, sub 1, of the Teaching and Examination Regulations 2024-2025.</p> <p>Disclaimer: information may change depending on unforeseen circumstances or measures (see: TER Art 2, sub 5).</p>                                                                                                                                                   |   |
| <b>maximum aantal deelnemers</b>       | <p>Expected number of student: Maximum of 30. Use Brightspace and inform our secretary Mitch Bloem (m.a.bloem@tudelft.nl) for attending the course.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |   |

| <b>Course Contents</b>                 | <p>Modelling is an important tool for gaining deeper insight in the working principles and loss mechanisms of solar cells and photovoltaic systems. Researchers use this insight to develop more efficient solar cells and to maximize the energy yield of photovoltaic systems.</p> <p>In this course we will cover the entire photovoltaic modelling chain: modelling of photovoltaic materials, devices (solar cells), modules and systems. The focus will be on understanding the working principles of these models, and using them to analyse the effects of design parameters on solar cell and photovoltaic system performance.</p> <p>The online course material consists of two parts, each consisting of several phases:</p> <ol style="list-style-type: none"> <li>1) PV materials and device modelling <ol style="list-style-type: none"> <li>1.1) PV materials and device characterization</li> <li>1.2) optical modelling of PV devices</li> <li>1.3) electrical modelling of PV devices</li> </ol> </li> <li>2) PV systems modelling <ol style="list-style-type: none"> <li>2.1) modelling of irradiance</li> <li>2.2) modelling of energy yield</li> </ol> </li> </ol> <p>In addition there will be software demos, given by expert users, allowing you to familiarize yourself with the advanced modelling software commonly used by PV researchers.</p> <p>The prior knowledge from the courses PV basics and PV systems is required. This course PV modelling will prepare you for an MSc thesis project that involves modelling of solar cells or photovoltaic systems, as well as a future career in photovoltaics research.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |   |
| <b>Study Goals</b>                     | <p>The online course material consists of two parts: 1) PV materials and device modelling, 2) PV systems modelling. Each consist of several phases:</p> <p>At the end of phase 1.1 (characterization of PV materials and devices) you should:</p> <ul style="list-style-type: none"> <li>Be familiar with the main techniques used in the characterization of PV materials and devices</li> <li>Understand the importance of a correct characterization for the modelling of PV</li> <li>Be able to extract useful and important information (trends and properties) from the characterization of both PV materials and devices</li> </ul> <p>At the end of phase 1.2 (optical modelling of PV devices) you will;</p> <ul style="list-style-type: none"> <li>have a complete overview of the modelling approaches commonly used for photovoltaic optical modelling, and which are their strength and limitations</li> <li>get a thorough understanding of different optical modelling methods and which structures they are best suited to model</li> <li>improve and practice your skills on optical modelling, by carrying out activities with our own GenPro4 software</li> </ul> <p>At the end of phase 1.3 (electrical modelling of PV devices) you should be able to:</p> <ul style="list-style-type: none"> <li>have a complete overview of the modelling approaches commonly for photovoltaics, both optical and electrical</li> <li>get a thorough understanding of different electrical modelling methods</li> <li>improve and practice your skills on optical and electrical modelling, by carrying out activities with our own advanced semiconductor analysis (ASA) software.</li> </ul> <p>At the end of phase 2.1 (modelling of irradiance) you should be able to:</p> <ul style="list-style-type: none"> <li>Gather and analyse meteorological data, including the utilization of geographic information systems,</li> <li>Obtain information on horizon and shading at a specific location, and derive the relevant location parameters,</li> <li>Combine meteorological data and location properties to calculate the irradiance on the angle of incidence with different levels of detail, and</li> <li>Optimize the orientation of a module to maximize the irradiance on the angle of incidence.</li> </ul> <p>At the end of phase 2.2 (modelling of the energy yield) you should be able to:</p> <ul style="list-style-type: none"> <li>Model the operating temperature of modules,</li> <li>Obtain information from module datasheet,</li> <li>Combine module properties with temperature and irradiance modelling to calculate DC power (and yield),</li> <li>Model the performance of inverters (DC to AC) and batteries,</li> <li>Analyse load profiles, and use them to size a PV system (module and batteries), and</li> <li>Calculate the AC power and energy yield of an entire system, and analyse its performance from an economic point of view.</li> </ul> <p>After the software demos you will be able to explain the input, working principles and output of the following commonly used software packages:</p> <ul style="list-style-type: none"> <li>Complete EASE (extracting optical constants from spectroscopic ellipsometry measurement of PV materials)</li> <li>HFSS (rigorous solving of Maxwell equation for EM-wave (light) propagation in PV devices)</li> <li>Sentaurus (modelling charge transport in PV devices by solving semiconductor equations)</li> <li>Radiance (PV module plane of array irradiance calculation using backward ray-tracing)</li> <li>PV Syst (PV system energy yield calculation)</li> </ul> |   |
| <b>Education Method</b>                | <p>This course consists of recorded video lectures, interactive lectures and instructions. The video lectures provide you with the basic information. The interactive lectures give you the opportunity to ask questions to the teacher and discuss selected topics in depth. In addition you will work on modeling assignments. During the instruction sessions the modeling assignments will be explained and feedback will be given on your (preliminary) results.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |   |
| <b>Assessment</b>                      | <p>Every week you make and submit modeling assignments, which are graded. The weighted average counts for 70% of the final grade. In addition, every week you write a short report about the software demo, which is graded as well. The average of this counts for the remaining 30% of the final grade.</p> <p>In case of an insufficient final result, or in case you missed a week (e.g. due to illness), you will be offered a repair option, consisting of a resubmission of the assignments for one of the weeks.</p> <p>Disclaimer: information may change depending on unforeseen circumstances or measures (see: TER Art 2, sub 5).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |   |

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Remarks</b> | <p>The on-campus Q&amp;A session is not mandatory. Because the course material (video lectures, live demos) is given online, this course can also be taken by students who cannot physically come to the campus.</p> <p>Because the assessment is done through weekly assignments, without an exam, the final grade (and credits) can be obtained already before the exam period (end of October). This can be relevant for those who have not yet obtained sufficient credits to start their graduation project.</p> |

| <b>Course Contents</b>                 | <p>The aim is to offer you an advanced practical course on solar cells and photovoltaic systems. The following areas of practical training will be part of the course:</p> <ol style="list-style-type: none"> <li>(1) Characteristics of artificial and natural light</li> <li>(2) Characterization of the performance of lab-scale solar cells</li> <li>(3) Behavior of photovoltaic modules in different temperature and shading conditions</li> <li>(4) Charge and discharge properties of batteries</li> <li>(5) Performance of power electronic components (charge controllers, inverters, maximum power point trackers)</li> <li>(6) Operation of entire photovoltaic systems</li> </ol>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |   |
| <b>Study Goals</b>                     | <p>By the end of the course, you should be able to:</p> <ol style="list-style-type: none"> <li>(1) Experiment with photovoltaic systems and all of their components under lab and real-life conditions.</li> <li>(2) Describe the working principle behind each component of a photovoltaic system.</li> <li>(3) Analyze the operation of all the elements of photovoltaic systems and of the system as a whole.</li> <li>(4) Compare the performance of different types of components of photovoltaic systems.</li> </ol>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |   |
| <b>Education Method</b>                | Laboratory sessions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |   |
| <b>Literature and Study Materials</b>  | Manuals and templates are available on BrightSpace.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |   |
| <b>Prerequisites</b>                   | This course is meant for students who have already passed at least the PV Basics course (ET4376) and preferably also PV Technologies (ET4377) and PV Systems (ET4378).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |   |
| <b>Assessment</b>                      | <p>The assessment is based on reporting results from the individual tasks using an Excel template provided on Brightspace. Two-person teams will be formed at the plenary session, the attendance of which is compulsory. The final grade is per team. The final grade is the average of the six technical reports. A grade <math>\geq 5.0</math> in all six technical reports is required to complete the course successfully. The final grade is per team and is calculated as the average of the six technical reports. In case of failure of a technical report, you can use buffer sessions on weeks 1.7 and 1.8 to repeat the experiments.</p> <p>---</p> <p>A virtual version of this course is made available for students to attend in Q2, Q3, and Q4. Each of the six tasks of the on-campus course will run in the internet browser of your choice in the form of a web application accessible via Brightspace. The assessment of the online version is entirely automatic, using numerical exercises and multiple-choice questions. A grade <math>\geq 5.0</math> in all six tasks is necessary to pass the course. The final grade is the average of the six grades. A maximum of one retry session is allowed. Attending one of these instances of the course, no teams will be formed, and the final grade is individual.</p> <p>In case of an insufficient final result, repair options may exist in accordance with Article 17A Times and number of examinations, sub 1, of the Teaching and Examination Regulations 2024-2025.</p> <p>Disclaimer: information may change depending on unforeseen circumstances or measures (see: TER Art 2, sub 5).</p> |   |
| <b>Enrolment / Application</b>         | <p>The on-campus course can accommodate up to 24 students. Anyone interested in attending this course must apply as soon as possible.</p> <p>In case of applications exceeding the capacity, a selection process will take place and, before the beginning of the instance in Q5, the line-up of students will be announced.</p> <p>Student(s) who failed on-campus in Q5 can re-take the virtual version of the course.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |   |
| <b>Remarks</b>                         | <p>This practical course will be given on campus only in Q1.</p> <p>Conversely, a virtual version will be available for students to attend in Q2, Q3, and Q4. The enrolment is open on Brightspace from Q1.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |   |

| <b>Summary</b>                         | <p>This is a mixed lectures and project-based course. The course consists of at least 8 plenary lectures and a group project:</p> <ul style="list-style-type: none"> <li>- The lectures will cover the basics of thin film technology: deposition techniques, vacuum technology, film growth, microstructure and application domains. The lectures have the purpose to provide the necessary background and technological information to fuel the group projects.</li> <li>- The project consists of carrying out in a group (typically ~3 students) a literature research on a specific thin-film materials topic, which can be chosen from a shortlist of topics or is self-chosen. The students will present their joint group research in oral and written form.</li> </ul> <p>Plenary progress presentations will be given to the class. By the end of the course, each group will hand in a final paper and will give a final presentation to conclude their work.</p>                                                                                                                                                                                                                                                                                                                                              |   |
| <b>Course Contents</b>                 | <p>The course consists of 8 plenary lectures and a student project.</p> <p>The topics of the lectures are</p> <ol style="list-style-type: none"> <li>1. Introduction, liquid deposition techniques</li> <li>2. Physical vapor deposition (evaporation &amp; sputtering)</li> <li>3. Chemical vapor deposition</li> <li>4. Atomic layer deposition</li> <li>5. Plasma surface treatment</li> <li>6. Nucleation &amp; Growth modes</li> <li>7. CVD diamond</li> </ol> <p>The project consists in carrying out in a group of few students a literature research on a specific thin film topic, chosen out of the following:</p> <ol style="list-style-type: none"> <li>1. hard coatings</li> <li>2. self-lubricating coatings</li> <li>3. optical coatings</li> <li>4. decorative coatings</li> <li>5. thin films in micro/nano devices (MEMS/NEMS)</li> <li>6. thin-film based batteries</li> <li>7. thin-film photovoltaics</li> <li>8. coatings for implants</li> </ol> <p>The students can also propose a topic of their own interest.</p> <p>The students will prepare a literature review paper on their topic and will present their progress in several plenary presentations. The class will challenge them with critical questions. At the end of the course a final presentation will be given by all groups.</p> |   |
| <b>Study Goals</b>                     | <p>At the end of the course, the student is able to:</p> <ol style="list-style-type: none"> <li>1. describe the various liquid and vacuum deposition technologies</li> <li>2. discuss the pros and cons of each of these techniques</li> <li>3. identify deposition-microstructure-properties relationships for a given deposition method</li> <li>4. explain the main mechanisms of thin film growth</li> <li>5. find, extract and order relevant information from open literature</li> <li>6. explore new trends in thin films and their applications</li> <li>7. professionally present information in written and oral form</li> <li>8. critically assess the information found</li> <li>9. critically assess the information presented by the other groups</li> <li>10. cooperate with groupmates such that everybody is responsible for the content.</li> </ol>                                                                                                                                                                                                                                                                                                                                                                                                                                                     |   |
| <b>Education Method</b>                | <p>Lectures and assignments (literature study in group, presentations, discussions, paper, and peer review). Lectures and presentations will be given on TU Delft campus.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |   |
| <b>Literature and Study Materials</b>  | <p>Course material will be shared by the teacher and posted on Brightspace.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |   |
| <b>Assessment</b>                      | <p>The grade will be composed as follows:</p> <ol style="list-style-type: none"> <li>1. Final paper 50%</li> <li>2. Final presentation 30%</li> <li>3. Mid-term presentations 20%</li> </ol> <p>A facultative, individual multiple-choice quiz is held towards the end of the lecture series. In addition, a peer evaluation form will be used to assess whether all team members have equally contributed to the work.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |   |

| <b>Expected prior knowledge</b>        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |   |
| <b>Course Contents</b>                 | <p>The microscopic structure and dynamics of condensed matter in physics, chemistry and biology is obtained by a wide variety of scattering techniques. Structures are determined on length scales ranging from 10<sup>-11</sup> to 10<sup>-5</sup> m, dynamics on time scales from 10<sup>-14</sup> to 10<sup>-6</sup> s. In this course we discuss the different neutron, X-ray and positron techniques, illustrated by a broad range of scientific and technological applications, for which recent scientific articles will be studied.</p> <p>After a general introduction an overview is given of the scattering theory, both for neutrons and X-rays. Then the different techniques will be discussed in more detail. Diffraction (either by X-rays or neutrons) yields information about the structure of single crystals, powders, and liquids. Small-angle scattering (SAXS and SANS) reveals the shape and arrangement of colloidal systems, micelles or polymers in a solvent. Reflectometry is used to find the composition of layered structures like proteins adsorbed at surfaces or magnetic layers in recording materials. Polarized neutrons are used in two different ways. First, for determining magnetic structures and dynamics. Second, as a special technique (spin-echo) to study the larger length scales and time scales (polymer dynamics). Inelastic scattering measures phonons in crystals, diffusion in liquids and the vibrational spectrum of molecules. Neutron sources (fission and spallation), X-ray sources (from X-ray tube, via synchrotron to XFEL) and instrumentation will be an integral part of this course.</p> <p>An introduction to positron annihilation (PA) will be given. Positron annihilation lifetime, Doppler Broadening techniques are particularly suited for the detection and characterisation of (open volume) defects such as vacancies, vacancy clusters and voids in e.g. metals, alloys, semiconductors and polymers. The main application of the Angular Correlation of Annihilation Radiation (ACAR) technique is the study of the electronic structure of solids, and that of defects, precipitates and nanocrystals.</p> <p>A visit to the neutron and positron experimental facilities at the Reactor Institute Delft will be part of the course.</p> |   |
| <b>Study Goals</b>                     | <p>Being able to explain the theoretical background of neutron and X-ray scattering and positron annihilation techniques;<br/> Being able to talk about the applications of these techniques;<br/> Being able to perform basic calculations and interpretations of the techniques;<br/> Being able to read and discuss recent articles on the application of the techniques;<br/> Being able to talk in depth about one of the topics to be chosen by the candidate in combination with a recent research article.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |   |
| <b>Education Method</b>                | <p>The course consists of 14 times 2 hours contact on the following chapters:<br/> I. Theoretical background neutron and X-ray scattering<br/> II. Neutron experimental techniques<br/> III. X-ray experimental techniques<br/> IV. Diffraction from crystalline materials, theoretical, experimental, application<br/> V. Diffraction from amorphous materials and liquids, theoretical, experimental, application<br/> VI. Small-angle scattering, theoretical, experimental, application<br/> VII. Reflectometry, theoretical, experimental, application<br/> VIII. Polarized neutrons, theoretical, experimental, application<br/> IX. Imaging and tomography with neutrons and X-rays, theoretical, experimental, application<br/> X. Positron annihilation, theoretical, experimental, application</p> <p>Each 2-hours-lecture is accompanied by a set of assignments from the website <a href="https://e-learning.pan-training.eu/">https://e-learning.pan-training.eu/</a>. This has to be completed before the next class. In the class question about the previous lecture will be discussed as well as recent scientific articles. In turn the students have to give short presentations about the assignments and about the scientific articles.</p> <p>Those students who have attended at least 12 of the 14 lectures and sent in at least 11 of the 13 assignments are allowed to enter the oral exam.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |   |
| <b>Literature and Study Materials</b>  | <p>Lecture notes. The accompanying material with the website <a href="https://e-learning.pan-training.eu/">https://e-learning.pan-training.eu/</a>.<br/> For mathematical background we recommend the book D.S. Sivia, Elementary Scattering Theory for X-ray and Neutron Users, Oxford University Press, ISBN 978-0-19-922868-3.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |   |
| <b>Assessment</b>                      | <p>Having done at least 11 of the 13 times homework is a requirement for taking the oral exam. The oral exam of 45 minutes determines the final grade. The student proposes an article or scientific topic connected to the course for the first 15 minutes of the exam.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |   |

| <b>Course Contents</b>                  | <p>Electrochemistry provides an important platform to convert (renewable) electricity into valuable products, chemicals, fuels and coatings. This course provides an overview of several electrochemical processes of societal importance, linking fundamental understanding with applied utilization. The scope of the course will cover processes from the nanoscale to the meter-scale, and methods to understand fundamental phenomena in practical systems.</p> <p>This course will include:</p> <ul style="list-style-type: none"> <li>- Electrochemical potentials and definitions (electromotive force, formal potential, Donnan potential)</li> <li>- Types of electrochemical reactions (reversibility, multi-step reactions)</li> <li>- Electrochemistry at liquid-solid, liquid-liquid, solid-solid and gas-solid interfaces</li> <li>- Electrode reaction kinetics in steady and unsteady state (Cottrell equation)</li> <li>- Microscopic theories of charge transfer and (Marcus model, energy states, tunneling)</li> <li>- Ion transport through diffusion and migration</li> <li>- Electrochemical characterization techniques (cyclic voltammetry, chronopotentiometry, impedance, etc.)</li> <li>- Electric double layers (Helmholtz model, Gouy-Chapman model)</li> <li>- Examples of water electrolysis, CO<sub>2</sub> reduction</li> <li>- Industrial electrochemical systems (large scale electrolyzers, batteries, etc.)</li> <li>- Electrochemical equipment (potentiostats, reference electrodes, electrodes, electrolytes, membranes)</li> <li>- Experimental setup (including practicum)</li> </ul> |   |
| <b>Study Goals</b>                      | <p>After this course, the student is able to:</p> <ul style="list-style-type: none"> <li>- Explain electrochemical responses in complex electrochemical cells (steady and non-steady state, and mono- or multi-ionic systems) to peers;</li> <li>- Demonstrate how theories for electrochemistry thermodynamics, kinetics (Marcus model, Tafel model) and electrolyte processes are applied to basic redox systems</li> <li>- Break down limiting factors (overpotentials or limiting currents) in given practical electrochemical conversions</li> <li>- Set up and perform suitable electrochemical tests for characterizing redox couples in practical electrochemical conversions</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |   |
| <b>Education Method</b>                 | <p>This course consists of:</p> <p>Instruction videos,<br/>Lectures and exercise sessions (combined),<br/>Practicum,<br/>Guest lectures</p> <p>Please be aware that attendance at the practicum is mandatory. The practicum will be scheduled 2x a timeslot of 2 hours in March.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |   |
| <b>Literature and Study Materials</b>   | <p>Bard &amp; Faulkner, Electrochemical methods fundamentals and applications, 2nd edition</p> <p>Please stick to the 2nd edition of the book, and do not buy the 3rd edition! The 2nd edition is less expensive and more useful for the course.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |   |

| <b>Expected prior knowledge</b>         | BSc: general and inorganic chemistry, basic quantum chemistry                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |   |
| <b>Course Contents</b>                  | Ceramic materials show a wide variety in chemical, optical and electrical properties. They are used in many different applications, ranging from catalysts, fuel cells, batteries and sensors to solar cells, photo-catalysts and luminescent nanoparticles. This course will treat the basic properties of functional ceramic materials. The following topics will be included: - crystal structures - bonding in inorganic solids - basic electronic structure and properties of semiconductors - defect chemistry including point defects, non-stoichiometry and doping - ionic and electronic charge transport - semiconductor junctions and space charges. |   |
| <b>Study Goals</b>                      | After this course, the student is able to:<br>- Correlate crystal structure and band structure to optical and electrical properties of ceramic materials<br>- Describe the operating principles of simple devices based on semiconductor junctions (solar cells, diodes, photo-electrodes) and ionic conduction (Nernst sensors, (Li-ion)-batteries, solid oxide fuel cells (SOFCs), and catalysts)<br>- Identify and predict relationships between point defects, dopants, space charges, and ionic/electronic conduction in both semiconductors and ionic conductors, and perform simple calculations                                                         |   |
| <b>Education Method</b>                 | Lectures, self study, instruction classes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |   |

| <b>Study Goals</b>            | At the end of this course, students will be able to:<br>Analyze both traditional and electrochemical processes able to produce fuels and feedstocks without the input of fossil fuels.<br>Evaluate the effect of intermittency on the operation and scaling of these processes.<br>Compare thermochemical and electrochemical conversion processes and their current technology readiness levels<br>Understand and explain the necessity of using ambient molecules (H <sub>2</sub> O, CO <sub>2</sub> , N <sub>2</sub> ) for a successful energy transition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |   |
| <b>Education Method</b>       | Standard 2-hour lectures will be used throughout the course. The lectures provide learning activities to introduce the conceptual material, and for students to test this out in example. These relate to the above learning objectives.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |   |
| <b>Assessment</b>             | We use Brightspace forums as an outside of class hours medium for discussion and questions.<br>The course grade will be assessed fully by a 100% Final Exam taking place in the regular exam periods.<br><br>In case of an insufficient final result, repair options may exist in accordance with Article 17A Times and number of examinations, sub 1, of the Teaching and Examination Regulations 2024-2025.<br><br>Disclaimer: information may change depending on unforeseen circumstances or measures (see: TER Art 2, sub 5).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |   |

| <b>Expected prior knowledge</b>        | Basic thermodynamic principles. Prior knowledge of (electro)chemistry will be helpful but is not required.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |   |
| <b>Course Contents</b>                 | <p>Fuel cell systems convert the chemical energy in fuels directly into electricity, enabling clean and efficient power generation from renewable fuels. This course provides an overview of different fuel cell systems and discusses the various fuel cell types, working principles and characteristics. Particular attention is given to design, integration, operation and application of polymer electrolyte membrane fuel cell (PEMFC) and solid oxide fuel cell (SOFC) systems.</p> <p>Specific topics include:</p> <ul style="list-style-type: none"> <li>- Fuel cell principles and fuel cell types.</li> <li>- Electrochemical power production: open circuit voltage and reversible voltage, the Nernst equation, fuel cell voltage and efficiency, fuel and oxidant utilization.</li> <li>- Fuel cell polarization: current density, activation losses, fuel crossover and internal currents, ohmic losses, concentration losses.</li> <li>- PEMFCs: electrolyte materials and structure, electrode materials and structure, gas channels and separator plates, water management, cell cooling, fuel and air supply, system design.</li> <li>- SOFCs: electrolyte materials, electrode materials and structure, configuration, design and performance of cells, stacks and systems, internal and external reforming, combined cycles.</li> <li>- Fuel processing: desulphurisation, reforming, partial oxidation, water gas shift, purification, combustion of residual fuel, gasification and gas cleaning, heat integration.</li> <li>- System thermodynamics: exergy losses in fuel cell systems and components.</li> <li>- Applications: systems for stationary power production and mobility.</li> </ul> |   |
| <b>Study Goals</b>                     | <p>After completing this course, you should understand physical and chemical processes taking place in a fuel cell and be able to create conceptual designs of fuel cell systems for different electricity generation applications.</p> <p>More specifically, you should be able to:</p> <ol style="list-style-type: none"> <li>1. Describe the physical and chemical processes taking place in different types of fuel cells.</li> <li>2. Calculate fuel cell voltage, power and fuel consumption in various operating conditions.</li> <li>3. Select appropriate the balance of plant components for a particular fuel cell and fuel type.</li> <li>4. Design and evaluate different fuel cell-based systems with using system thermodynamics.</li> <li>5. Appraise various fuel cells with regard to their characteristics and intended application.</li> </ol>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |   |
| <b>Education Method</b>                | lectures / tutorials / self-study                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |   |

| <b>Parts</b>                           | The lectures are given in the 3rd and 4th period (second semester), in 2 hour lectures weekly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |   |
| <b>Course Contents</b>                 | <p>Introduction to rotary wing aerodynamics. Applications in aircraft, propulsion, fans and wind turbines. Conservation laws. Actuator disk/momentum theory. Limitations. Helicopter rotor vertical flight and windmill brake state. Figure of merit. Wind turbine Betz optimum. Lift and drag devices</p> <p>Blade elementmomentum method, Tip correction methods. Correction for finite nr. of blades and heavily loaded rotors.</p> <p>Aerodynamic characteristics of airfoils for rotor application. Aerodynamic properties of pitch and stall controlled wind turbine. Wind turbine rotor blade design.</p> <p>Vortex line methods. Vortex wake structure. Frozen and free wake, vortex core modelling.</p> <p>Vortex panel methods. Advanced wake models. Acceleration potential method.</p> <p>Detailed rotor near wake structure. Experimental wake velocities and wake vorticity structure.</p> <p>3D effects, Stall delay. Yawed flow and dynamic inflow. Autogiro, helicopter rotor in forward flight.</p> <p>Unsteady aerodynamics and dynamic stall effects. Theodorsens Theory. Effects of tower shadow and wind shear.</p> <p>Aeroacoustics and rotor aeroacoustics.</p> <p>Vertical axis wind turbine rotor and Voight-Schneider propeller</p> <p>Effects of inflow turbulence intensity on blade loads. Near and far wake structure</p> <p>Wind farm aerodynamics. Rotor-wake interaction. Single and multiple wakes. Effects upon loads and performance.</p> |   |
| <b>Study Goals</b>                     | <p>Provide an overview of the phenomena and models present in aerodynamics of rotors, with special emphasis in horizontal axis wind turbine rotors. Propellers, vertical axis (crossflow) wind turbine rotors and helicopter rotors will also be addressed, but with less detail.</p> <p>"Hands on" introduction to the different computational models used nowadays to analyse the aerodynamics of rotors.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |   |
| <b>Education Method</b>                | Lecture and exercises + 3 group assignment + final written (digital) or oral exam                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |   |

| <b>Course Contents</b>                  | CFD for Aerospace Engineers sets the grounds of the essential physical, mathematical, and numerical models for turbulent fluid flows and shows the opportunities and limits of fluid flow simulations in the aerospace industry. This course includes: (1) short survey of history, basic equations and dimensionless numbers, (2) turbulence theory and models for turbulence simulations with DNS, RANS, LES, (3) generation of suitable computational grids, (4) discretization methods, boundary conditions, effect of numerical truncation (5) solvers for large linear systems, error and residuum, (6) visualization, (7) validation and verification, (8) hands-on tutorials with ANSYS CFX and OpenFOAM. |   |
| <b>Study Goals</b>                      | After completion of this course, students (1) know and understand the methods and models used in state-of-the-art CFD software, (2) are able to set-up and run CFD simulations, and (3) can critically analyze and evaluate CFD results.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |   |

| <b>Course Language</b>                 | English                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |   |
| <b>Expected prior knowledge</b>        | <p>Familiarity with MATLAB and basic aircraft design knowledge.</p> <p>MATLAB is used for tutorials and home assignment, thus students without MATLAB experience must gain this through self-study</p> <p>Students with no experience in aircraft design should consult textbooks like Torenbeek, Raymer and Roskam to familiarize with the fundamentals of wing sizing process and general concepts such as wing loading, aerodynamic coefficients, fuel fraction method, drag and its components, etc.</p>                                                                                                                                                                                           |   |
| <b>Course Contents</b>                 | <p>The course will introduce students to multidisciplinary design optimization (MDO), as a modern methodology to support complex product development.</p> <p>Main topics:</p> <ul style="list-style-type: none"> <li>- What and why MDO</li> <li>- Parameterization techniques</li> <li>- Numerical optimisation methods (focus on gradient based methods)</li> <li>- Decomposition and coordination of complex computational systems</li> <li>- the eXtended Design Structure Matrix (XDSM)</li> <li>- MDO architectures</li> <li>- Intro to surrogate modeling, discrete&amp;mixed integer problems, genetic algorithms and Multi Objective Optimisation</li> </ul>                                  |   |
| <b>Study Goals</b>                     | <p>The main goals are the following:</p> <ul style="list-style-type: none"> <li>- understanding of Multidisciplinary Design Optimization (MDO) methods and architectures</li> <li>- hands-on experience in setting up and solving MDO problems</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                              |   |
| <b>Education Method</b>                | <p>The course consists of classical lectures and computer tutorials using own laptop.</p> <p>During the tutorials, students are introduced to some of the tools discussed during lecture and can make hands-on experience during interactive sessions with the teachers. In particular, students will be introduced to the MATLAB optimization function fmincon and its use for gradient based optimization.</p> <p>A significant amount of time is left for self-study, where students will have to work in pairs on one take-home assignment.</p>                                                                                                                                                    |   |
| <b>Computer Use</b>                    | <p>The use of a personal computer is required</p> <p>MATLAB (including its optimization toolbox) will be used for the MDO practical sessions and assignment. Student licenses are provided by the TUD</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |   |
| <b>Literature and Study Materials</b>  | <ul style="list-style-type: none"> <li>- lecture sheets and some notes (only available digitally on Brightspace)</li> <li>- scientific papers</li> <li>- some software modules</li> <li>- Suggested (not compulsory) book: <ul style="list-style-type: none"> <li>- Multidisciplinary design optimization supported by knowledge based engineering. By J. Sobieszczanski-Sobieski, A. Morris and M. van Tooren, Wiley ISBN 978-1-118-49212-3</li> <li>The book is available in e-format from the TUD library (Chapter 9 is used in the course AE4204 on Knowledge Based Engineering)</li> <li>- Engineering Design Optimization, by J.R.R.A. Martins and A. Ning (free on line)</li> </ul> </li> </ul> |   |
| <b>Assessment</b>                      | <p>There is no conventional exam for this course.</p> <p>The assessment is based on the quality of one take-home assignment, which will be executed in teams of two students.</p> <p>The assignment is about setting up and solving an MDO problem using Matlab. The deliverables are the Matlab code and a report.</p> <p>Two different take-home assignments are defined for the two yearly examination sessions.</p>                                                                                                                                                                                                                                                                                |   |

| <b>Course Language</b>                 | English                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |   |
| <b>Course Contents</b>                 | This course will cover how the output of wind farm arrays is predicted based on modelling of the wind resource and combined wake interactions. The first part of the course will cover the different wind resource models which are used ranging from simple mass consistent models, to linearised solvers, computational fluid dynamics models and mesoscale models. The use of models in both onshore and offshore environments will be covered including the importance of atmospheric stability. The second part of the course will consider the application of models to assess the yield from wind farms considering wakes effects. Wake models will be reviewed including simple semi-empirical models to kinematic models and the modelling of wakes in CFD models. Once again, the importance of atmospheric stratification will be considered and the potential impact on wind farms of certain mesoscale phenomena, e.g. gravity waves offshore, will be assessed and quantified. Large wind farm phenomena will be studied including the so-called deep array effect and wind farm blockage. |   |
| <b>Study Goals</b>                     | Course Aim: to give students a firm foundation in how to predict wind farm yield from prevailing wind conditions.<br><br>Course Objectives:<br><br>1) To understand what tools are available to predict wind resource over a wide area<br>2) To apply to such models to potential wind farm sites onshore and offshore<br>3) To quantify the importance of terrain effects and atmospheric stability on the wind resource<br>4) To understand what tools are available to predict wake effects in a large wind farm<br>5) To apply wake models in a realistic wind farm situation<br>6) To appreciate the importance to wind farm yield of phenomena such as terrain complexity (onshore), proximity to the coast (offshore), atmospheric stability, mesoscale effects (e.g. gravity waves), wind farm layout and wind farm scale                                                                                                                                                                                                                                                                        |   |
| <b>Education Method</b>                | Students will learn through a combination of guided reading, group work, online resources (e.g. lectures, videos, quizzes), face-to-face lectures, coursework and exams.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |   |
| <b>Assessment</b>                      | The students will undertake two course assignments (resource assessment and wind farm yield prediction) worth 30% each, spread out during the course and an oral exam worth 40% at the end of the course.<br><br>Assignment 1: application of a model to assess and optimise wind resource and energy yield for an onshore site with a report to be assessed.<br>Assignment 2: application of a model to assess and optimise energy yield for an offshore site incorporating different wake models with a report to be assessed.<br>Exam: oral test to assess understanding of the principles of wind resource assessment and wind farm yield prediction.                                                                                                                                                                                                                                                                                                                                                                                                                                                |   |

| AE4W31                                 | Floating Offshore Wind Energy                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | 3 |

| <b>Course Contents</b>                 | <p>This course introduces the topic of floating offshore wind energy, a fast-growing field in offshore wind energy, which consists in placing offshore wind turbines on a floating support structure. The course highlights the need for floating offshore wind, the main challenges compared to conventional bottom-fixed offshore turbines, and the impact on the industry as a whole. More specifically, topics covered in the course are:</p> <ul style="list-style-type: none"> <li>- Why floating offshore wind, ongoing projects and trends</li> <li>- Aerodynamics and control of floating offshore wind turbines</li> <li>- Hydrodynamics of floating offshore wind turbines</li> <li>- Small-scale and full-scale testing</li> <li>- Logistics and project development of large floating offshore wind farms</li> <li>- Alternative wind turbine concepts for floating foundations</li> </ul> |   |
| <b>Study Goals</b>                     | <p>After completing the course, the students will be able to:</p> <ul style="list-style-type: none"> <li>- Explain the relevance and need for floating offshore wind energy in the current energy transition</li> <li>- Derive appropriate aerodynamic and hydrodynamic models for floating offshore wind turbines</li> <li>- Calculate the effect of a floating motion on the turbine performance</li> <li>- Define guidelines for testing floating offshore wind turbines in wind tunnels and wave tanks</li> <li>- Explain the industrial challenges in developing a large floating offshore wind farm</li> <li>- Explain the differences between bottom-fixed and floating turbines in the overall supply chain</li> <li>- Explain pros and cons of different wind energy concepts in a floating environment</li> </ul>                                                                             |   |
| <b>Education Method</b>                | The course consists of live lectures, assignments and self-study materials on Brightspace. Guest lecturers from industry and other Faculties/Universities will also participate in the course to reflect the multi-disciplinary nature of floating offshore wind energy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |   |
| <b>Assessment</b>                      | The course is assessed through a written exam at the end of the course and the assignments performed during the course.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |   |

| <b>Expected prior knowledge</b>        | It is expected that the student has taken all the previous courses in the power electronics teaching line: ET4119, ET4116, ET4145                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |   |
| <b>Course Contents</b>                 | The focus of this course is on providing both in-depth theories and practical knowledge regarding the power converter design that are not covered in the previous courses. The topics include power converter control, switching behaviour, power loss modelling, passive components, and thermal management.                                                                                                                                                                                                                                                                                                                                                    |   |
| <b>Study Goals</b>                     | <p>The lab practicum provides a chance to test the performance of the power switches and control of power converters</p> <p>After this course, the students will be able to</p> <ul style="list-style-type: none"> <li>- explain the concerns and trade-offs in the power converter design, including the switching - behavior, the passive components, the thermal management, and control</li> <li>- use the knowledge and design a grid-tied inverter with given requirements regarding THD, efficiency and size</li> <li>- use simulation tools to evaluate the converter design</li> <li>- test with the lab setup, and analyse the test results</li> </ul> |   |
| <b>Education Method</b>                | Lectures and lab                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |   |

Different model-structures.<br/> Prediction models in state-space setting. Standard predictive control scheme. Relation standard form with GPC, LQPC and other predictive control schemes. Solution of the standard predictive control problem. Stability of MPC.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |   |
| <b>Study Goals</b>                     | <p>By taking this course, the student</p> <ul style="list-style-type: none"> <li>- will be able to master the introduced theoretical concepts in systems theory and feedback control design and</li> <li>- will be able to practically apply these concepts to design projects and tasks</li> <li>- and will be able to relate the learned concepts and techniques to other more specialized ones, to potentially integrate them by taking adjacent courses.</li> <li>- will be able to translate a predictive control problem into a standards setting and solve the predictive control problem.</li> </ul> <p>More specifically, the student will be able to:</p> <ul style="list-style-type: none"> <li>- Translate differential equation models into state-space and transfer function descriptions</li> <li>- Rationalize differences between state-space and transfer function approaches</li> <li>- Linearize a system, determine its equilibrium points, analyze directly its local stability, leverage Lyapunov theory to study general stability properties</li> <li>- Describe the effect of eigenvalue/pole locations to the dynamic system response in time/frequency domain. Contrast step and impulse responses. Analyze transients and steady-state</li> <li>- Investigate model controllability. Formulate and apply the procedure of pole-placement by state-feedback, as well as LQ optimal state-feedback control</li> <li>- Derive observability properties. Formulate and apply the procedure of state estimation and build converging observers</li> <li>- Formulate the separation principle and employ it for the design of output feedback</li> <li>- Build reference models and achieve zero steady-state error using integral control.</li> <li>- set up a predictive control problem.</li> <li>- Solve the standard predictive control problem;</li> <li>- Master the main analytical details in stability proofs of predictive control schemes;</li> </ul> |   |

| Course Contents                 | <p>ME41106 Intelligent Vehicles is an introduction course on the (on-board) AI technology of automated driving. Whereas the application setting is that of vehicles, most concepts apply to the broader mobile robotics setting. Students seeking a one-course overview of AI for mobile robotics are thus encouraged to attend, also from outside ME (e.g. EEMCS, Civil Engineering and Aerospace Engineering faculties).</p> <p>Introduction<br/>Course organization<br/>Intelligent Vehicles (IV) domain<br/>Motivation for automated driving<br/>SAE levels of automation<br/>Main components of IV technology<br/>Remaining challenges<br/>Sensor Overview (camera, radar, LiDAR)<br/>3D Machine vision<br/>Perspective camera model<br/>Extrinsic and intrinsic camera transformations<br/>Stereo vision<br/>Object Detection and Classification<br/>Detection vs. classification<br/>Object proposals<br/>Handcrafted features (e.g. HOG) &amp; classification (e.g. linear SVM)<br/>End-to-end learning: neural networks, deep learning<br/>Performance metrics: confusion matrices, precision vs. recall, ROC curves<br/>State Estimation<br/>Bayesian Filtering<br/>Kalman Filtering<br/>Particle Filtering<br/>Object Tracking<br/>Data Association<br/>Track Management<br/>Self-Localization &amp; Sensor Fusion<br/>Absolute vs. relative localization<br/>Ego-motion compensation (e.g. odometry)<br/>Extrinsic sensor calibration<br/>Environment representations (grids, voxels)<br/>Motion Planning<br/>Planning as graph-search (the A* algorithm)<br/>Trajectory generation and optimization<br/>The Road Ahead<br/>IV technology currently on the market<br/>Future developments</p> <p>The course has a substantial practicum component (about 65% of course work load), where learned concepts are put into practice by means of programming assignments (Python, using Jupyter notebooks).</p> |   |
| Study Goals                     | At the end of the course students will understand the main methodical components of a intelligent vehicle (mobile robot). They will be able to program basic algorithms and test these on simulated and real-world data. Students will be able to express an educated opinion on the benefits and risks of automated driving, the current developments from driver assistance to driver-less cars, and the forces driving this transformation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |   |
| Education Method                | <p>Lectures (2-4 hours per week)<br/>Practicum (2 hours per week)</p> <p>Formative feedback: Practica<br/>- Pairwise collaboration (alternating random groups)<br/>- Pass/Fail (counts for knock-out criteria)<br/>- No late submissions or resit (except due to motivated medical conditions)</p> <p>Students can in principle run the software locally on their own computers (laptop/PC). However, we provide no support for setting up the necessary software environment (i.e. Anaconda). If the software environment cannot be installed properly (e.g. a few processors like M1 and ARM might not work), the student will need to revert to using the computers in the designated lab rooms.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |   |
| Course Relations                | <p>This course, ME41106 Intelligent Vehicles <i>*cannot*</i> be selected in combination with RO47004 Machine Perception, due to the content overlap between the courses. This means, for example, that this course ME41106 cannot be selected by students following the MS Robotics program (for which RO47004 is required).</p> <p>This course mainly addresses the on-board AI technology of an intelligent vehicle. Complementary to this course is CIE 5805 Intelligent Vehicles for Safe and Efficient Traffic: Design and Assessment which focuses more on automated vehicles as part of a larger intelligent transportation system (i.e. including smart infrastructure, connected/cooperative driving) and on associated issues at the macro level (e.g. traffic flow efficiency, fuel consumption, behavior adaptation).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |   |

| <b>Course Contents</b>                 | <p>This course provides fundamental knowledge on vehicle motion, vehicle-road interaction and the main technical principles and aspects of automotive control systems. This course discusses vehicle modelling, controller design and testing procedures to evaluate vehicle motion and automotive control systems.</p> <p>Tire dynamics and modelling<br/>Wheel slip, slip angle, tire force / moments, influence of camber angle, pressure, temperature effect, combined slip, friction circle, transient behavior<br/>Tire modelling and wheel dynamics</p> <p>Lateral motion and vehicle handling<br/>Kinematics, understeer gradient, bicycle model, steady-state handling<br/>Transient motion, frequency response, handling testing, vehicle stability</p> <p>Antilock braking system (ABS) and vehicle dynamics control (VDC)<br/>General concepts of ABS and different control principals: rule-based, mixed slip-deceleration, advanced control techniques<br/>General concept of VDC, yaw rate based controller, body slip angle based controller, integrated vehicle control using control allocation</p> <p>Planar motion<br/>Planar vehicle modelling<br/>Static equilibrium, lateral load transfer, roll center and axis, roll stiffness, anti-roll bars<br/>Longitudinal load transfer, pitch center, anti-dive, anti-lift</p> <p>Steering &amp; assist logic<br/>Wheel kinematics, steering system modelling, column- and rack-assist<br/>Steering assist logic, steering feel and assessment</p> <p>Path-following and evasive control of automated vehicles<br/>Vehicle road model, error definition, an overview of path-following controllers, PD controller<br/>Evasive maneuver, advanced control techniques, MPC-based evasive steering assist</p> <p>Vertical motion and comfort<br/>Introduction to vibration, quarter car, 2DoF and 3DoF models, Ride comfort<br/>Suspension control: skyhook, groundhook, and mixed control</p> <p>Vehicle state estimation<br/>General concept of VSE, vehicle velocity estimation, Kalman filtering (linear and extended), wheel load reconstruction methods</p> <p>Final presentations of the group project</p> |   |
| <b>Study Goals</b>                     | <p>After successfully completing this course, you will be able to:</p> <ul style="list-style-type: none"> <li>explain the tire-road interaction and be able to implement the tire model and compare it with the established one</li> <li>describe the concept of vehicle handling and lateral stability and derive the equations of motion of a nonlinear vehicle model</li> <li>interpret the load transfer effects and implement four-wheel planar vehicle model including the wheel kinematics, steering system and steering assist logic</li> <li>explain the concepts of wheel slip control, vehicle stability control, automated lateral control and vehicle state estimation</li> <li>implement control strategies for vehicle stability control (PID with gain scheduling or LQR) and automated lateral control (MPC)</li> <li>derive the equations of vertical motion of a quarter-car vehicle model and explain the influence of vehicle and road parameters on vehicle vibration behaviour</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |   |
| <b>Education Method</b>                | <p>Lectures (4 hours per week)<br/>Office hours (2 hours per week)<br/>Group project &amp; presentation</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |   |
| <b>Prerequisites</b>                   | <p>Basic programming experience (e.g. Matlab / Simulink) at the BSc level<br/>Dynamics and control at the BSc level<br/>knowledge about Model Predictive Control is recommended</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |   |

| <b>Required for</b>                    | This course is part of the MSc Industrial Ecology (joint degree between Leiden University and Delft University of Technology). The course builds up on the knowledge and skills taught in the first semester of the MSc Industrial Ecology. This course is part of the MSc Industrial Ecology (joint degree between Leiden University and Delft University of Technology). The course builds up on the knowledge and skills taught in the first semester of the MSc Industrial Ecology.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |    |
| <b>Course Contents</b>                 | <p>Many sustainability challenges are related to urban systems and industrial systems. The way urban and industrial environments and their infrastructures are built and transformed and how people live in them and work in them has an impact on greenhouse gas emission, resource depletion, pollution and the generation of waste.</p> <p>In this course, we approach urban environments and industrial systems from an ecosystem perspective. We focus on three important flows energy, water, construction materials, and resources. Analyzing these flows reveals the complexity of urban and industrial environments. The flow systems are related in multiple ways. An intervention to improve one flow can have a negative impact on another flow. Spatial interventions hold potentials for synergies, for example between an improved local water management and more liveable green spaces for local inhabitants, or the possibility to find the synergy between an industrial cluster and an urban area nearby.</p> <p>To understand and work with this complexity, we start with a careful analysis of a provided urban plan or a provided industrial network, that can be described as an eco-industrial park or a circular economy region. Each flow system of the plan is analyzed and modelled. The outcomes are combined into an integral sustainability assessment of the provided urban plan or provided industrial network.</p> <p>In the second part of the course, the assessment forms the base for improvements the provided urban plan or industrial network. The shape and position of the buildings and open spaces are adjusted where needed and flow related improvements are translated to spatial interventions. Or in the case of the industrial network, the outline of the process, the flowsheet, or the value chain are translated to design interventions. This can lead to conflicts between different interventions. Therefore, trade-offs are identified and negotiated while synergies are thought and strengthened. Here, aspects as spatial qualities, cluster behaviour, liveability and ecology are taken into account as well, leading to an integrated new urban plan or industrial network.</p> <p>This new plan or network is put in the institutional context of its location. Stakeholders that are relevant for a successful realization and maintenance of the plan are identified. The final outcome is an improved, integrated and implemented sustainable urban development or sustainable industrial development.</p> <p>For acting successfully in the complexity of urban environments and industrial environments negotiation, collaboration and communication are crucial skills. Therefore, this course pays extra attention to transferable skills in this field.</p> <p>This course is part of the joint degree MSc Industrial Ecology, offered by Leiden University and Delft University of Technology. More information about the course is published in the online study guide of Leiden University:<br/> <a href="https://studiegids.universiteitleiden.nl/en">https://studiegids.universiteitleiden.nl/en</a></p> |    |
| <b>Study Goals</b>                     | <p>After completing this course, you are able to</p> <ul style="list-style-type: none"> <li>- Assess the sustainability of a provided urban plan or provided industrial system by applying calculation models for key resource and waste flows.</li> <li>- Propose spatial and technical adjustments that improve the provided urban plan or provided industrial system, based on your assessment. You are able to analyze the effect of your adjustments by applying your calculation models and use the gained insight to further elaborate the plan accordingly.</li> <li>- Identify trade-offs and synergies between your proposed improvements and key qualities of urban plans or industrial systems. You are able to argue, how trade-offs should be mitigated and synergies should be strengthened. You are able to translate your argumentation into further improvements, leading to an integrated sustainable urban plan or industrial system.</li> <li>- Relate your improved urban plan or industrial system to a provided institutional context. You are able to identify key stakeholders required for a successful and synergetic implementation and maintenance of your improved and integrated sustainable urban plan or industrial system.</li> <li>- Apply several transferable skills, such as collaboration, presenting and giving feedback.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |    |

| <b>Course Contents</b>                  | Housing renovation processes are challenging social-technical systems. In this course, students gain knowledge of sustainable renovation from different perspectives (social, technical, financial, environmental) and apply gained insights and knowledge in a feasibility study for a housing renovation project. The interests of all stakeholders have to be merged to result in a successful renovation.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |   |
| <b>Study Goals</b>                      | Understand the roles of existing and new stakeholders in integrated renovation processes. Insight in life-cycle cost analysis (LCCA) and financial case, energy demand and energy calculations on building and neighbourhood scale, environmental impact and environmental life cycle assessment (LCA) of buildings and renovation. Insight in health and comfort of residents. Implementation and integration of gained knowledge in a feasibility study of a renovation project.                                                                                                                                                                                                                                                                                                                                                                                        |   |
| <b>Education Method</b>                 | Challenge-based didactical approach: the assignment is a tender game of a feasibility study for a housing renovation project. Lectures cover several perspectives of integrated climate proof adaptations of the built environment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |   |
| <b>Literature and Study Materials</b>   | All literature will be handed in class.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |   |
| <b>Assessment</b>                       | Tender Game 50% of grade and Written Exam 50% of grade.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |   |

| <b>Course Language</b>                 | English                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |   |
| <b>Expected prior knowledge</b>        | A BSc. in Architecture is highly preferred and recommended in order to have design skills and some basic knowledge of climate design and sustainability. The MOOC Zero Energy Design is also recommended to do, especially for students that did not do their BSc. in Delft. This can also be done at the start of the course.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |   |
| <b>Course Contents</b>                 | <p>The urgent issue of an energetically poor performing existing building stock is the subject of Zero Energy Design. The energy use of these buildings, to become comfortable for its users, comes with considerable carbon emissions; as does the electricity use of its residents. But also the use of new materials to upgrade or transform these buildings causes some initial carbon emissions. Within the assignment of ZED, an existing residential building block has to be transformed into a zero carbon building with net zero energy use and net zero carbon emissions. So, all carbon emissions, from the energy use of the building and the users, as well as the carbon emissions embedded in the material use for renovation, have to be compensated by sustainable energy production on-site. With the successive steps (of the New Stepped Strategy) of reducing the demand, re-using waste streams and producing the remaining demand with renewables, a combination of smart measures has to be defined to reach this goal. Smart energy connections with the surrounding built environment will also be considered.</p> <p>The focus of this course lies on a well-integrated climate design and well-balanced energy system that makes the building carbon neutral or even provides a negative carbon footprint. The building has to be transformed in an architectonically attractive way, including additional space and functions, to become future proof.</p> <p>With an energy potential mapping analysis of the neighbourhood and an energy performance calculation program, tools are provided to quantify and prove the final carbon and energy performance.</p> |   |
| <b>Study Goals</b>                     | <p>The student is able to:</p> <ul style="list-style-type: none"> <li>- develop an integrated energy-neutral climate design</li> <li>- make energy calculations and optimize the energy performance of a building</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |   |
| <b>Education Method</b>                | <p>Lectures, interactive lectures, excursion, computer exercises, writing a report, presenting.</p> <p>The assignment will in principle be completed in groups of 3.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |   |
| <b>Assessment</b>                      | <p>Knowledge of the theory is tested through a report and an oral presentation.</p> <p>Students should achieve a minimum grade of 6.0 to pass this course. In case a grade is 5.0 or 5.5, students will get the opportunity to repair the assignment within a period of 2 weeks from the result announcement, a successful repair will be assessed with a 6.0.<br/>(A retake can be done in the next year)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |   |
| <b>Period of Education</b>             | Quarter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |   |
| <b>Concept Schedule</b>                | Monday afternoon                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |   |

| Course Language                | English                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |    |
| Course Contents                | <p>MEGA is a collaborative design studio where students work in multi-disciplinary teams to make an integrated design of a large multi-functional building. Students work in teams of 5 to 8 students in which they are each responsible for one discipline. The disciplines cover different (technical) aspects of building design like architectural design, structural design, climate design, façade design, computational design, and urban design. The course targets master students in Building Technology, Architecture and Urbanism, welcomes students from Civil Engineering and is open to non-TU Delft students (conforming with TU Delft regulations).</p> <p>By working in multi-disciplinary teams, MEGA closely matches the design process of large international projects in the competition phase. This allows students to specialize in one discipline and teaches them to collaborate and communicate with students that represent other disciplines. The disciplines are divided amongst the team members and each member is responsible for the contribution and integration of these aspects in the collective design. The design collaboration is supported by an integrated design process that supports on computational modelling (including parametric design, performance analysis, multi-disciplinary computational optimization or design exploration). The course is supported by external international design and engineering offices. As examples from recent years, support was given by Arup, UNStudio, ABT Neutelings Riedijk Architecten, MVRDV, DGMR, Techniplan, Packhunt, Thornton Tomasetti, Foster &amp; Partners, Stichting Hoogbouw.</p> <p>Sustainability runs throughout the course and the different disciplines, and becomes apparent in the interdisciplinary collaboration. More specifically, this course regards the construction of large buildings in a perspective of sufficiency: how can we increase the density in urban regions with a limited amount of energy and materials? In doing so, it touches upon aspects of climate adaptation and resilience, circularity, renovation.</p> |    |
| Study Goals                    | <p>The student is able to design a coherent, significant, elaborated, correct and innovative design - on mainline and on aspects on MSC 2 level.</p> <p>Specified for this course:<br/>After successful completion of the course, the student will be able to:</p> <ul style="list-style-type: none"><li>- work in an interdisciplinary design process;</li><li>- understand and apply discipline-related knowledge in projects for large or tall buildings.</li><li>- develop design strategies to achieve high building performance;</li><li>- integrate numeric analysis and simulations data to address design choices.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |    |
| Education Method               | <p>In this course, the education methods are:</p> <ul style="list-style-type: none"><li>- Lectures</li><li>- Collaborative workshops with other students</li><li>- Exposure to external architectural practice and external experts</li><li>- Tutoring</li><li>- Presentations</li></ul> <p>The course is structured in three phases. The first phase consists of lectures, workshops and a site visit. Many external guests (international practitioners) will join for the lectures and workshops. Through the workshops, students learn specific skills that are useful for the group work or for their specific discipline. In the second phase, students develop a sketch design, exploring several design options. They are supported in this by a team of tutors, for the different disciplines. In a third phase, they elaborate the design for a specific option.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |    |
| Literature and Study Materials | <p>Specific literature is provided at the start of the course in Brightspace. The literature below provides an indication on relevant general content.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |    |
| Assessment                     | <p>Assessment is twofold:</p> <ul style="list-style-type: none"><li>- Group assessment for integral group design based on presentations</li><li>- Individual assessment for discipline report</li></ul> <p>The students mark is a combination of the group assessment and individual assessment.</p> <p>Students should achieve a minimum grade of 6.0 to pass this course. In case a grade is 5.0 or 5.5, students will get the opportunity to repair the assignment within a period of 2 weeks from the result announcement, a successful repair will be assessed with a 6.0.</p> <p>A retake can be done in the next year.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |    |
| Enrolment / Application        | <p>Students are required to register for courses and exams in both the Bachelor's and Master's programmes. For more information, see:<br/><a href="https://www.tudelft.nl/en/student/a-be-student-portal/practical-affairs/enrolment-education-exams">https://www.tudelft.nl/en/student/a-be-student-portal/practical-affairs/enrolment-education-exams</a><br/>Additional enrolment information for non-BK students:</p> <p>Course enrolment via Brightspace only is not considered a valid registration<br/>Enrolment in the BK-enrolment system BIS (<a href="https://bis.bk.tudelft.nl/">https://bis.bk.tudelft.nl/</a>) does not guarantee placement; there may be a maximum number of non-BK participants for this course (see below)<br/>The course can be taken only after confirmation of placement in BIS by BK-enrolment</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |    |

| <b>Summary</b>                         | This quarter focusses on the making or remaking of the city and this course more specially on the city as technical construction: the natural and man-made conditions of the urban landscape, in order to integrate all interest in an urban plan. The act of integration and design requires systemic knowledge on a wide range of subjects. In this course the city is seen as a technical construction, with the central question being how to reconnect this construction to the natural systems of the territory? Therefore, this course provides vital input for the parallel studio of Q2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |   |
| <b>Course Contents</b>                 | <p>In the master track Urbanism students learn to integrate social, cultural, economic and political perspectives with the natural and man-made conditions of an urban landscape in order to shape and plan for more sustainable urban development. This quarter focusses on the making or remaking of the city and this course more specially on the city as technical construction: the natural and man-made conditions of the urban landscape, in order to integrate all interest in an urban plan. The act of integration and design requires systemic knowledge on a wide range of subjects. In the course the city is seen as a technical construction, with the central question being how to reconnect this construction to the natural systems of the territory?</p> <p>In new to build areas, or green fields, there is a lot of freedom to engineer or not to engineer the natural system. One of the greatest urban challenges these days is urban renewal. This is a complex enterprise in itself because you deal with the existing urban use and fabric. On top of that we need to deal with trends like climate change and the energy transition. One dimension that is reintroduced in the urban project is the subsurface system, which plays a crucial role in water management, ecology and energy supply. The subsurface system was for a long time excluded from the urban planning and design process, because it was considered a technical aspect that was dealt with by civil engineers, not as part of the urban design. However, the subsurface sets the conditions with highest impact: it is more costly and takes more time to change a cable system then it is to build a building or construct a road. Especially the idea that the natural system has already been altered for urban use, and thus lost, is preventing innovative solutions that deal with climate change and the energy transition in urban renewal. In order to incorporate natural and technical conditions in urban plans, a better cooperation with civil engineers and a better understanding of what they do not know is crucial for urban designers. This is what the course aims at.</p> <p>To bring order in all the technical information we make use of the System Exploration Environment and Subsurface (SEES) that uses six functional layers with different dynamics, professional domains and knowledge fields: people, metabolism, occupation, public space, infrastructure and subsurface. The subsurface layer is ordered in (for the urban planner and designer) recognizable themes: water, energy, civil constructions and subsoil. Within the themes there is a logical order in the qualities of the subsurface (<a href="http://www.ruimtexmilieu.nl">www.ruimtexmilieu.nl</a>). SEES connects the subsurface information with the urban surface in order to inspire and set clear boundaries for the development of the urban surface. It is used for analysing potential problems, chances, demands and supports a creative interaction early in the process of urban planning.</p> |   |
| <b>Study Goals</b>                     | <p>At the end of this course, students are able to:</p> <ul style="list-style-type: none"> <li>Explain what for them is sustainable development and how technology is integrated.</li> <li>Evaluate the skills of an urban designer in relation to sustainability.</li> <li>Explain the city as a hybrid system of natural and human characteristics both the surface and subsurface level.</li> <li>Analyse the synergy between natural and human systems on the surface and subsurface level.</li> <li>Identify new approaches in which the conditions and chances that are given by the natural system are re-introduced.</li> <li>Demonstrate and design spatial principles or an urban ensemble with the desired performances, by combining design and engineering, including natural and human systems on the surface and subsurface level to develop ethical standards considering sustainable development.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |   |
| <b>Education Method</b>                | Interactive lectures and intensive workshops, full time three weeks starting in week 2 of the quarter. Mainly group work.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |   |
| <b>Literature and Study Materials</b>  | Mandatory and recommended literature will be mentioned on the specific Bright Space page at least one week prior to the start of the course.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |   |
| <b>Assessment</b>                      | <p>The assessment of the assignments is done using the rubric that is available in the quarter guide on the course specific Bright Space page. There are a set of grades in which there is differentiated between assessment of 1) the individual contribution to the group results/products and 2) the quality of the groupwork itself.</p> <p>A rubric will be used for grading. The rubric will be available in the quarter guide or on the course specific Bright Space page.</p> <p>Students should achieve a minimum grade of 6,0 to pass this course. Grades 5,0 5,5 may be considered for a Repair. A Repair is provided when only one specific part (one Learning Objective) of the assignment is missing or insufficient. The student receives a well described written repair assignment. The assignment must be handed in by the student on Friday 12.00 h. in the white week between Q2 and Q3, thus in the week between academic weeks 2.10 and 3.1, or the first week of summer, thus week 5.1. This will be mentioned in the written repair assignment. The result of the repair assignment may only be Pass or Fail. In case of Pass a V is registered in Osiris. In case of a Fail the original grade between 5,0 and 5,5 is registered in Osiris. In case of a final grade below 6,0 the student needs to reenroll for the course.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |   |
| <b>Enrolment / Application</b>         | <p>Students are required to register for courses and exams in both the Bachelor's and Master's programmes. For more information, see: <a href="https://www.tudelft.nl/en/student/a-be-student-portal/practical-affairs/enrolment-education-exams">https://www.tudelft.nl/en/student/a-be-student-portal/practical-affairs/enrolment-education-exams</a></p> <p>Additional enrolment information for non-BK students:</p> <p>Course enrolment via Brightspace only is not considered a valid registration</p> <p>Enrolment in the BK-enrolment system BIS (<a href="https://bis.bk.tudelft.nl/">https://bis.bk.tudelft.nl/</a>) does not guarantee placement; there may be a maximum number of non-BK participants for this course (see below)</p> <p>The course can be taken only after confirmation of placement in BIS by BK-enrolment</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |   |
| <b>Remarks</b>                         | The maximum marking period is 15 working days.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |   |
| <b>Period of Education</b>             | Quarter 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |   |
| <b>Concept Schedule</b>                | <p>The AR1U131 course is 15 days scheduled in the first 4 weeks of Q2. The AR1U131 course schedule is tuned with the AR1U100 course.</p> <p>The actual schedule will be available via Bright Space &gt; My Timetable.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |   |
| <b>Minimum number of participants</b>  | For mandatory courses of the Master track of Urbanism the minimum number of participants is 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |   |

|                                       |                                                                                              |

| <b>Course Contents</b>                 | <p>This course provides an overview of motion planning and decision-making techniques and their practical application in robotics. Planning and Decision-making are critical components of autonomy in robotic systems. These components are responsible for making decisions that range from path planning and motion planning to coverage and task planning to taking actions that help robots understand the world around them better. This course studies underlying algorithmic techniques used for planning and decision-making in robotics and examines case studies in ground and aerial robots, mobile manipulation platforms and multi-robot systems. The students will learn the algorithms and implement them in a series of programming-based projects.</p> <p>In particular, we will first cover the fundamentals of planning (workspace, configuration space, representation of obstacles and robot models). We will then cover a broad set of methods, which include reactive methods and feedback control; discrete, combinatorial and probabilistic planning; planning under differential constraints; planning under uncertainty; learning in planning; and planning for multi-robot systems. Finally, we will briefly touch upon task assignment and vehicle routing.</p> <p>Course structure:<br/> Introduction<br/> Fundamentals: 3D rotations, configuration space, algorithm properties<br/> Differential constraints: recap of modeling &amp; control of manipulators, ground robots, aerial robots<br/> Graph-search fundamentals (depth/breadth first, Dijkstra, A*, heuristics)<br/> Combinatorial algorithms (cell decomposition, shortest-path roadmaps, motion primitives)<br/> Sampling-based algorithms (PRM, RRT, RRT*)<br/> Reactive algorithms: collision avoidance, potential fields, velocity obstacles<br/> Kinodynamic planning<br/> Trajectory optimization (fundamentals, global, local, Model Predictive Control)<br/> Planning under uncertainty (Markov Decision Processes, learning)<br/> Multi-robot motion planning (joint configuration, optimization-based, coverage)<br/> Task assignment (Hungarian, auction, linear program)<br/> Intro to vehicle routing</p> |   |
| <b>Study Goals</b>                     | <p>After completing this course, students will be able to:</p> <ul style="list-style-type: none"> <li>explain the role of Motion Planning and Decision-Making (PDM) in Robotics, and describe possible applications</li> <li>identify different classes of robotic systems, the associated mathematical models for their kinematics, dynamics and motion and the relevant spaces for PDM, such as the configuration and state spaces</li> <li>describe and compare algorithms for motion planning and decision-making of mobile robots and multi-robot systems, including: reactive algorithms, optimization-based algorithms, combinatorial algorithms, sampling-based algorithms and learning-based methods</li> <li>analyze a PDM problem, consider constraints, objectives and select the appropriate PDM methods to apply</li> <li>design and implement motion planners of moderate complexity to solve motion-planning tasks and navigate mobile robots</li> <li>perform PDM experiments, evaluate the results, and draw sound conclusions</li> <li>present the findings of a PDM experiment clearly in a report using graphs and scientific English</li> <li>understand PDM experiments descriptions found in scientific literature, and reproduce results</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |   |

| <b>Course Contents</b>                 | <p>State-space description of single-input, single-output linear dynamic systems, interconnections, block diagrams. Linearization, equilibria, stability, Lyapunov functions and the Lyapunov equation. Dynamic response, relation to modes, the matrix exponential. Realization of transfer function models by state space descriptions, coordinate changes, canonical forms. Controllability, stabilizability, uncontrollable modes and pole-placement by state-feedback. Application of LQ regulator. Observability, detectability, unobservable modes, state-estimation observer design. Output feedback synthesis and separation principle. Reference signal modeling, integral action for zero steady-state error; Analysis in robust stability and robust performance.</p> <p>Basics of model predictive control (MPC). Different model-structures. Prediction models in state-space setting. Standard predictive control scheme. Relation standard form with GPC, LQPC and other predictive control schemes. Solution of the standard predictive control problem. Stability of MPC.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |   |
| <b>Study Goals</b>                     | <p>By taking this course, the student</p> <ul style="list-style-type: none"> <li>- will be able to master the introduced theoretical concepts in systems theory and feedback control design</li> <li>- will be able to practically apply these concepts to design projects and tasks</li> <li>- and will be able to relate the learned concepts and techniques to other more specialized ones, to potentially integrate them by taking adjacent courses.</li> <li>- will be able to translate a predictive control problem into a standards setting and solve the predictive control problem.</li> </ul> <p>More specifically, the student will be able to:</p> <ul style="list-style-type: none"> <li>- Translate differential equation models into state-space and transfer function descriptions</li> <li>- Rationalize differences between state-space and transfer function approaches</li> <li>- Linearize a system, determine its equilibrium points, analyze directly its local stability, leverage Lyapunov theory to study general stability properties</li> <li>- Describe the effect of eigenvalue/pole locations to the dynamic system response in time/frequency domain. Contrast step and impulse responses. Analyze transients and steady-state</li> <li>- Investigate model controllability. Formulate and apply the procedure of pole-placement by state-feedback, as well as LQ optimal state-feedback control</li> <li>- Derive observability properties. Formulate and apply the procedure of state estimation and build converging observers</li> <li>- Formulate the separation principle and employ it for the design of output feedback</li> <li>- Build reference models and achieve zero steady-state error using integral control.</li> </ul> <ul style="list-style-type: none"> <li>- set up a predictive control problem.</li> <li>- Solve the standard predictive control problem;</li> <li>- Master the main analytical details in stability proofs of predictive control schemes;</li> </ul> |   |
| <b>Education Method</b>                | Lectures 4/0/0/0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |   |

| <b>Course Contents</b>                 | <p>This course provides fundamental concepts from the field of Institutional Economics that are instrumental for the design of institutions in socio-technical systems. Relevant frameworks and theories will be elaborated in relation to the design of socio-technical systems. The fundamentals of institutional economics will be applied to concrete design challenges, like the transition to sustainable infrastructures. It will be demonstrated how to relate Institutional Economics to interdisciplinary research challenges, including engineering, political science, law and philosophy. This provides interesting perspectives to other courses in the curriculum. Typical questions that are addressed in this module include:</p> <p>What is the specific contribution of Institutional Economics to the design of socio-technical systems?<br/> How to frame and interpret design challenges from an Institutional Economic perspective?<br/> What is an institutional design?<br/> How can institutional designs be related to the technical design of complex systems?<br/> How to operationalize concepts from institutional economics and apply them to empirical design challenges?</p> |   |
| <b>Study Goals</b>                     | <p>After the completion of the course, the student is able to:</p> <ul style="list-style-type: none"> <li>to understand and analyse complex institutional arrangements from an Institutional Economic perspective</li> <li>reflect on the possible contribution of Institutional Economics in addressing different design challenges</li> <li>apply approaches from Institutional Economics to concrete design challenges</li> <li>position and apply different approaches from Institutional Economics to interdisciplinary design challenges.</li> <li>establish a coherent institutional design given the features of the technical system(s) embedded in their socio-political environment</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |   |

| <b>Expected prior knowledge</b>        | Students require prior knowledge of linear algebra, statistics, probability theory and data structures. Furthermore, basic Python programming knowledge is required. It is recommended (but not mandatory) to take the course EPA122A "Spatial Data Science".                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |   |
| <b>Course Contents</b>                 | <p>Machine Learning (ML) is increasingly seen as a crucial part of the puzzle to solving the socio-technical challenges of today's networked and urbanised knowledge-driven societies. Successful adoption of ML does, however, not only require skilled computer scientists who do hard-core programming. Also, professionals are needed who have both the domain knowledge of socio-technical systems and a profound understanding of ML.</p> <p>This course aims to provide students in the socio-technical domain with a profound understanding of ML. It prepares students for the challenges and questions ML will pose them in their later careers.</p> <p>To this end, the course consists of three parts:</p> <ol style="list-style-type: none"> <li>1. Fundamentals of ML</li> <li>2. Explainability of ML</li> <li>3. Applications of ML for socio-technical challenges</li> </ol> <p>In part 1, students learn about ML fundamentals and methods. These weeks, a critical technical foundation is laid for grasping the strengths and weaknesses of ML for the analysis and design of socio-technical systems.</p> <p>Part 2 is devoted to the explainability of ML. For public decision-making as well as for decision-making in high-stake contexts, such as, e.g. autonomous vehicles, legal systems transparency and explainability of the models are of critical importance. Students learn several popular explainability techniques and discuss their value for applications in socio-technical systems.</p> <p>In part 3, a group of scholars provides exemplary applications of ML in socio-tech systems. This serves two purposes: (1) to show where and how ML is applied for analysis and application in socio-technical systems and (2) to deepen reflection on the impact of ML-based solutions and interventions on individuals, organisations, and society. Consecutively, students work in a group on a final project, building forth on one of the presented applications. This project brings together the three parts of this course: Fundamentals of ML, Explainability of ML, and application of ML for socio-technical challenges. Students need to apply ML models and techniques to real-world data in a notebook and interpret and communicate their results, taking into account the socio-technical setting through a presentation.</p> <p>The course consists of oral lectures and lab sessions. The aim of the lab sessions is to show and reinforce how the ML models, explainable ML techniques, and ML ideas presented in the oral lectures are put into practice. Also, they help students gather hands-on machine learning skills. The lab sessions involve a series of exercises in the form of Jupyter notebooks.</p> <p>The course consists of ~2 oral lectures and 1 lab session per week. Attendance of the lectures and lab sessions is highly recommended to keep up with the course but is not mandatory.</p> |   |
| <b>Study Goals</b>                     | <p>After the course, students can:</p> <ol style="list-style-type: none"> <li>1. explain fundamental concepts of machine learning (ML).</li> <li>2. explain the workings of a selected number of ML models and eXplainable AI (XAI) techniques, and apply these to empirical data.</li> <li>3. identify applications of ML and XAI techniques in real-world socio-technical systems.</li> <li>4. examine the impact of ML-based solutions and interventions on individuals, organisations, and society through XAI.</li> <li>5. conduct an in-depth analysis of a real-world socio-technical challenge, by applying ML and XAI to empirical data.</li> <li>6. reflect on the strengths and limitations of ML and XAI in real-world socio-technical systems.</li> </ol>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |   |
| <b>Education Method</b>                | <p>The education methods used in this course are:</p> <ol style="list-style-type: none"> <li>1. Oral lectures with discussions</li> <li>2. Lab sessions</li> <li>3. Assignments</li> <li>4. Group work</li> </ol>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |   |

| <b>Study Goals</b>                     | After this course, you will be able to calculate phase and material properties in thermodynamic equilibrium for multi-phase and/or multi-component mixtures under ideal and non-ideal process conditions. You will be able to use equations of state and activity coefficient models, and to calibrate and validate those models using thermodynamic data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |   |
| <b>Education Method</b>                | Lectures, optional homework, review session                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |   |
| <b>Computer Use</b>                    | homework assignments require scientific computing tools such as python, Matlab (or comparable) and basic programming methods such as for loops                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |   |

| <b>Course Language</b>                 | English                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |   |
| <b>Expected prior knowledge</b>        | Elements of fluid dynamics, heat/mass transfer and thermodynamics, at the level of e.g. TUD Batchelor courses WB2542 and WB2543. Familiarity with modelling via PDE, at the level of e.g. WBMT2048.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |   |
| <b>Course Contents</b>                 | <p>This is a course in modelling of transport phenomena in energy storage materials and devices. It is an excellent introduction to multiphysics problems for students interested in learning how one can simulate or model the coupling of heat, mass and electricity in the devices that drive the energy transition. Example of such devices are batteries, supercapacitors, hydrogen/ CO<sub>2</sub> storage devices, or materials for heat storage. Many courses treat transport phenomena as separate subjects, while this course unifies different transport phenomena exploiting analogies between different transport fields, with an applied emphasis on energy materials.</p> <p>The course is particularly suitable for student wishing to later specialize in numerical simulation of conservation laws (e.g. CFD courses such as Computational Fluid Dynamics for Engineers); for students with an interest in experimental, theoretical or simulation-based fluid dynamics (e.g. as a foundation for the Turbulence, Rheology or Multiphase Flow courses) and who wish to learn about the coupling of momentum and species transport ; or for students who seek a solid preparation to face confidently the study of coupled transport theories used in the modelling of electrochemical and heat transfer systems, see e.g. the EFPT Electrochemical Energy Storage course.</p> <p>Different from other transport phenomena courses within the EFPT curriculum, this course covers the modelling of diffusive and convective transport of generic species in materials that are not homogeneous, but are made of different phases in the form of compacted dry powders, solid foams, inks, slurries etc. For example, the course covers how to estimate the effective electrical or heat conductivity of materials used as battery electrodes, a key issue when modelling batteries.</p> <p>Among other topics, the courses will give a practical introduction to Comsol Multiphysics, probably one of the most widespread software for the simulation of general multiphysics problems.</p> <p>Topics include:</p> <p><b>MATHEMATICAL MODELLING:</b> Mathematical analogies between conservation laws for heat, mass, electrons, ions and electric fields; Modes of microscopic transport: diffusion, convection, reaction/adsorption and their microscale modelling; From micro to macro: upscaling microscopic fluxes to the macroscale; the science behind engineering correlations; Extract general constitute laws for multiphysics fields: the most important ideas; Averaging of linear and non-linear equations; Bounds on transport properties for statistically homogeneous, periodic or percolating fields; effective conductivities of composites</p> <p><b>MICRO/NANOPHYSICS:</b> Coupling of mass, momentum or heat transport with electric fields: electrokinetic transport in bulk and at interfaces; Upscaling adsorption in porous media: application to hydrogen and CO<sub>2</sub> adsorption; How to analyse images, e.g. Scanning Electron Microscope images, to estimate transport properties in mesoporous materials</p> <p><b>NUMERICAL SIMULATIONS:</b> How to use commercial codes (e.g. Comsol or Fluent) to compute experimentally testable transport properties; basic approaches to the discretizations of coupled multiphysics problems</p> <p><b>APPLICATIONS:</b> use of the theory in practical case studies: battery electrodes, high-surface-area capacitors, hydrogen storage media, membranes for CO<sub>2</sub> sequestration, multicomponent/multiphase heat storage materials</p> |   |
| <b>Study Goals</b>                     | <p>After completion of the course, you will be able to:</p> <ul style="list-style-type: none"> <li>- Read confidently scientific or technical literature related to multiphysics transport in energy materials</li> <li>- Analyse experimental or simulation data for multiscale mesoporous materials to extract key transport properties such as, for example, multiphase heat/mass/electron conductivities</li> <li>- Develop computational models of engineering transport in energy materials and equipment, and evaluate the accuracy of meso- and macro-scale transport correlations used in these models</li> <li>- Learn how to be the go-to-person in multi-physics modelling in an industrial or scientific organisation, by learning the unique jargon and method of analysis of this field</li> <li>- Save time in your research by learning how to develop back-of-the-envelope calculations</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |   |
| <b>Education Method</b>                | The course is based on lectures on theory and practice, and in-class discussion of practical case studies. Lectures will be complemented by a few assignments analysing particular technologies. There is no single textbook: the study material is taken from book chapters, research knowledge, or scientific articles and will be given by the instructor. Some books will be suggested by the instructor for the students interested in learning certain topics more in depth.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |   |
| <b>Assessment</b>                      | Assessment is based on a written exam and an assignment on a multiphysics topic agreed with the instructor. The assignment includes research on a specific topic and a presentation in front of the class. The exam carries 50% of the final grade.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |   |

| <b>Expected prior knowledge</b>         | Economics of Infrastructures SPM2230 or EPA1233) or an equivalent introduction to micro economics is required.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |   |
| <b>Course Contents</b>                  | <p>Introduction, models of liberalization, network regulation</p> <p>Conceptual framework of market design</p> <p>Gas system &amp; actor description</p> <p>Electricity system &amp; actor description</p> <p>Long-term development of electricity markets</p> <p>Long-term development of gas markets</p> <p>Policy options for intervention in electricity and gas markets</p> <p>Perspectives on long-term, sustainable energy market design</p> <p>Energy market modeling</p> <p>Electricity market simulation game.</p>                                                                     |   |
| <b>Study Goals</b>                      | At the end of this course, students should be able to analyze energy policy issues from a technical, economic, and institutional perspective, to make informed choices regarding market design and policy options and to develop improvements to these options. In this course, the students technical, economic, legal and policy making skills are applied to the complex reality of regulation and market design in electricity and gas sectors.                                                                                                                                              |   |
| <b>Education Method</b>                 | The course makes use of interactive lectures. The reading materials are partly developed by ourselves and consist partly of relevant, recent policy-related documents. Quantitative modeling exercises are used to learn how electricity prices come about, the influence of policy instruments and renewable energy on these prices and to learn about investment decisions. An elaborate simulation game is used to apply this knowledge and gain insights in the dynamic, long-term development of an electricity market. Finally, an excursion provides in inside view in an energy company. |   |
| <b>Computer Use</b>                     | An exercise requires the development of a simulation model. Excel may be used for this purpose. In addition, an on-line market simulation game is part of this course.                                                                                                                                                                                                                                                                                                                                                                                                                           |   |
| <b>Literature and Study Materials</b>   | Readers and other reading materials such as scientific papers will be provided through the online learning environment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |   |
| <b>Assessment</b>                       | Digital exam (70%), modeling exercise (20%) and simulation game (10%). Each of these elements must be passed with a grade of 5,75 or higher.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |   |
| <b>Permitted Materials during Tests</b> | None.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |   |
| <b>Remarks</b>                          | This course overlaps in part with SET3055 and is therefore not available to M.Sc. SET students.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |   |

| <b>Course Contents</b>                 | The subsurface is increasingly used to store fluids associated with energy and for climate change mitigation. There are many potential technologies, and each has its place. In this module, the key technologies which are available and under-development are detailed, including key aspects of flow of fluids in the subsurface. These concepts are utilised to evaluate the technologies, such that we can efficiently use the subsurface. Students will move from broad concepts and how to assess the applicability (Learning Unit 1), through theoretical aspects of how the systems work (Learning Unit 2) to evaluation and design (Learning Unit 3).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |    |
| <b>Study Goals</b>                     | <p>After completion of this module the students are able:</p> <p>CO-SS-LO1. Explain how earth underground resources can be used and sustained in an environmentally responsible manner for cyclic storage of fluids and energy (ILO: 4, 10).</p> <p>CO-SS-LO2. Design a conceptual framework for a given storage project, considering the geology and geomechanics of the host rock and physics of fluids under dynamics (ILO: 1, 3, 4, 8, 11).</p> <p>CO-SS-LO3. Evaluate the performance of storage systems, including the influence of their design parameters and nearby systems (ILO: 4, 5, 6, 7, 9).</p> <p>CO-SS-LO4. Evaluate geochemical processes in order to evaluate the environmental performance of systems (ILO: 4, 5, 6, 7, 9).</p> <p>CO-SS-LO5. Weigh the various advantages and disadvantages of subsurface storage options against each other and propose an optimal solution (ILO: 3, 6, 9, 10).</p> <p>CO-SS-LO6. Communicate their findings clearly in an appropriate comprehensive manner for various technical and non-technical stakeholders (ILO: 2).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |    |
| <b>Education Method</b>                | <p>Teaching and learning that encourages students to take responsibility for their learning process:</p> <p>Learning Unit 1: Subsurface storage technology<br/>- Lectures. Book chapters and handouts specifically relevant to each lecture should be studied beforehand. In addition to theory explanation, students will be engaged through exercises and quizzes.</p> <p>Learning Unit 2: Heat, solute and compressible fluid transport<br/>- Lectures on the transport of dissolved substances and heat in groundwater. Small scale experimental demonstrations are given during the lectures in which students participate.<br/>- Based on the scientific contents of the lectures, practical sessions will be performed to model the fundamental concepts behind successful storage of fluids in the subsurface across scales. These are mostly in the form of weekly computer modelling exercises using, for example, MODFLOW, MT3D, SEAWAT, DARTS, DARSim, or MRST. Python scripts will be used to generate input files, read output files, and analyse the results.<br/>- Group experiments in the lab will be performed to quantify physics of the stored fluids, e.g. H<sub>2</sub> and CO<sub>2</sub>.</p> <p>Learning Unit 3: Storage design and evaluation project<br/>- Project based learning. Students will form multi-disciplinary groups. Each group will work on a specific energy scenario and conceptualise, design and evaluate a storage system based on their scenario. Groups will report findings on a weekly basis to other groups in form of oral presentations. These presentations will focus on the key messages to different stakeholders. These outputs will be formatively assessed. The final designs and evaluations will be communicated in writing (in form of report) and orally (via a presentation).</p> |    |
| <b>Practical Guide</b>                 | <p>Learning Unit 1: Subsurface storage technology (1 ECTS)<br/>Link to learning objectives of the module:<br/>CO-SS: LO 1, LO 5</p> <p>The various technologies related to subsurface storage and the evaluation of subsurface storage are detailed, including the current state of the art and future research directions. Theoretical and quantitative methods to gain insights into technical and environmental performance are taught. Evaluation methodologies, such as exergy analysis and multi-criteria analysis, are outlined.</p> <p>Topics:</p> <ul style="list-style-type: none"> <li>- Context of subsurface storage: <ul style="list-style-type: none"> <li>o global overview of Climate &amp; Energy status</li> <li>o from production to storage to mitigation.</li> </ul> </li> <li>- Overview of the technologies and advancements <ul style="list-style-type: none"> <li>o Energy storage in porous media &amp; cavities (reservoirs and salt caverns):<br/> <ul style="list-style-type: none"> <li>• Borehole thermal energy storage</li> <li>• Aquifer thermal energy storage</li> <li>• Hydrogen storage</li> <li>• Compressed air energy storage</li> <li>• Supercritical CO<sub>2</sub> energy storage</li> </ul> </li> <li>o Novel storage topics <ul style="list-style-type: none"> <li>o CO<sub>2</sub> storage</li> <li>o Water storage (managed aquifer recharge (MAR))</li> </ul> </li> </ul> </li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                            |    |

- Assessment methods
  - o Exergy Analyses
  - o Multi-criteria analysis
  - o Environmental performance
  - o Geomechanics

Learning Unit 2: Heat, solute and compressible fluid transport (6 ECTS)

Link to learning objectives of the module:

CO-SS: LO 2, LO 3, LO 4

The theoretical aspects of heat, solute and compressible flow in the subsurface are presented, including the flow of heat via conduction, advection and convection, the transport of dissolved solutes and the transport of compressible fluids (e.g. CO<sub>2</sub> and H<sub>2</sub>). Reactivity and the effect on transport, leading towards changes in properties or pollution are considered. The coupled behaviour of processes is detailed, e.g. the effect of temperature on physical properties and rate constants.

Topics:

- Solute transport in groundwater
- Heat transport in the surface and groundwater
- Coupled groundwater flow and concentration/heat transport
  - o density and viscosity dependency on salinity and temperature
- Reactive transport of contaminants
  - o Effect of temperature on rate constants.
  - o Mobilization, adsorption and resorption of trace elements due to flow/concentration/temperature
- Compressible fluid flow
  - o CO<sub>2</sub>
  - o H<sub>2</sub>
  - o Laboratory experiment (geochemistry): measuring CO<sub>2</sub> dissolution, pH change
- Subsurface flow
  - o Pore scale to km scale modelling
- Simulation methods
  - o Assignments and exercises using various open-source simulators: e.g. MODFLOW, MT3D, SEAWAT, PHT3D and/or PHAST, DARTS, DARSim, MRST
- Applications include seawater intrusion, managed aquifer recharge, aquifer thermal energy storage, CO<sub>2</sub> storage, contaminant plumes.

Learning Unit 3: Storage design and evaluation project (3 ECTS)

Link to learning objectives of the module:

CO-SS: LO 2, LO 3, LO 4, LO 5, LO 6

Students are presented with an energy scenario where they must evaluate the most appropriate storage concept and present a detailed design. The design must include predictions of performance, an evaluation of environmental impact and include analysis of uncertainties. The students must demonstrate the ability to select appropriate theory, modelling concepts and data, perform numerical analysis and critically evaluate the results to form conclusions. They must clearly and precisely communicate their results to their peers.

Topics:

- Scenario evaluation
- Application of theory and tools from other two units
- Critical evaluation of results
- Presentation of project via written technical report and presentation for different stakeholders (focus on non-technical users in the final presentation)

## Assessment

Formative assessment (feedback)

Learning Units 1 and 2

During the first two units weekly tasks have to be delivered. Tasks comprise written reports based on laboratory experiments, computer exercises and theoretical knowledge. In addition, class quizzes will be given.

The tasks will be formatively assessed on completeness and quality by involved lecturers. These build towards: (i) the portfolio, and (ii) the activities in Learning Unit 3.

Learning Unit 3

Groups will give weekly presentations on their progress and considering different stakeholders. The presentations will be formatively assessed on completeness and quality by involved lecturers, and peer feedback will be solicited. In addition, formative peer feedback within the group will encourage equal contribution.

Summative assessment (grading)

Portfolio of individual learning activities at the end of Learning Units 1&2

50% of final module grade.

Assessment based on:

Individual cumulative grade. Combination of (approximately) weekly assignments defined during lectures and workshops of Units 1 and 2. The students will have received formative comments after each assignment and can upgrade the assignments for the final grade.

Integrated module assessment at the end of Learning Unit 3

50% of final module grade.

Assessment based on:

Group report

Group presentation at the end of the project

Answering questions after the presentation

A 1-2 page(s) individual report on critical evaluation of all group studies (also to stimulate reading others group reports and actively ask questions during presentations and evaluate based on capacity, efficiency, safety, exergy, public perceptions, ).

A successful participation in the module, requires a minimum evaluation of 5.8 in all examinations

## Expected prior Knowledge

For all MSc students CE, ENV, AES.

## Academic Skills

Analysis of complex (multi-cause) problems, information collection and evaluation, multi-disciplinary and integral problem solving, project management, written and oral communication, teamwork.

## Literature & Study Materials

Learning Unit 1: Subsurface storage technology

Books:

- o The city of the future by BNA (Branchevereniging Nederlandse Architectenbureaus), publisher Blauwdruk (2019); and Stad x Klimaat Het gebouw als watermachine by BNA and TU Delft (2020) (in Dutch). The study is interactive available at <https://www.bna.nl/kennis/bna-onderzoek/stad-x-klimaat> which can be automatically translated by Chrome Browser to English, for international students. These books comprise and review a number of practical cases concerning integral ecoengineering solutions for socio-environmental problems occurring in the built environment.
- o Sustainable energy without the hot air by David Mackay: provides an overview of alternative energy options.
- o Carbon Dioxide Capture and Storage, by Intergovernmental Panel on Climate Change (UNEP): this open-access report provides guidelines for climate-driven actions related to subsurface storage of greenhouse gases, especially CO<sub>2</sub>.

| <b>Study Goals</b>                     | <p>At the end of this course, you will be able to:</p> <p>LO1 Explain the fundamentals of 'intelligent control' techniques - namely iterative control, Reinforcement learning, Model learning for control, etc.</p> <p>LO2 Implement 'intelligent control' techniques in Python.</p> <p>LO3 Reason on the expected performance of a given intelligent controller when applied to a given control problem.</p> <p>LO4 Propose an original, intelligent control scheme that can provide motor intelligence to a nonlinear and uncertain system (e.g., robot within a partially known environment).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |   |
| <b>Education Method</b>                | Lectures (recorded and in class) and one assignment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |   |
| <b>Course Relations</b>                | <p>Course title until 20/21 "Knowledge Based Control Systems"</p> <p>Course code until 21/22 "SC42050"</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |   |
| <b>Literature and Study Materials</b>  | <p>Lecture notes: R. Babuska. Knowledge-Based Control Systems.</p> <p>Slides and other course material (video lectures, software, demos, notes) can be downloaded from BrightSpace.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |   |
| <b>Assessment</b>                      | <p>The examination will be as follows:</p> <p>(i) practical assignment and (ii) written exam, open book.</p> <p>You must score at least 5.5 on both assignments to get a pass.</p> <p>In case of unforeseen circumstances or measures resulting from COVID-19, the prescribed assessment will be a remote open book with several fraud prevention measures.</p> <p>In accordance with the master program regulations:</p> <ul style="list-style-type: none"> <li>* The students will have the opportunity to resit if they fail the written examination.</li> <li>* If your practical assignment is graded between 5 and 5.75, you will have two weeks to integrate the assessors feedback. If this is done satisfactorily, you can be rewarded with a mark that is not higher than 6/10. The exact instructions for the addition will be announced after the grading of the PA is concluded.</li> </ul>                                                                                                                                                                                                                                                                                                                                         |   |
| <b>Enrolment / Application</b>         | <p>Registration:</p> <p>To participate in this course, registration via MyTUDelft is not needed.</p> <p>More information regarding course registration, the procedure, and current deadlines can be found on <a href="https://www.tudelft.nl/en/student/me-student-portal/education/related/registration-courses-and-examinations/courses">https://www.tudelft.nl/en/student/me-student-portal/education/related/registration-courses-and-examinations/courses</a>.</p> <p>To participate in midterms and endterms, (timely) exam registration is obligatory. | <b>Expected prior knowledge</b>         | basic experience with Matlab                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |   |
| <b>Course Contents</b>                  | <p>Essentially, almost all engineering problems are optimization problems. If a civil engineer designs a bridge, then one of the main objectives is to obtain the cheapest design or the design that can be implemented most rapidly, where of course several specifications and constraints such as size, strength, safety, etc. have to be taken into account. When developing a new type of engine, we look for the most economical design, the cheapest design, or the design with the highest performance. A process engineer wants a production unit to deliver a final product of maximal quality, with minimal expenditure of energy or with maximal output flow. When composing a portfolio, a financial engineer tries to maximize the expected profits, subject to the given risk constraints. So we encounter optimization problems in almost every engineering field.</p> <p>How can we solve such an optimization problem? That is the topic that will be addressed in this course. We will in particular discuss several classes of optimization problems and next focus on how to select most efficient numerical algorithms to solve a given optimization problem. The examples and case studies of this course are primarily oriented towards systems and control.</p> <p>More specifically, the following topics will be treated:</p> <ul style="list-style-type: none"> <li>* Linear Programming</li> <li>* Quadratic Programming</li> <li>* Nonlinear Optimization</li> <li>* Constraints in Nonlinear Optimization</li> <li>* Convex Optimization</li> <li>* Global Optimization</li> <li>* Matlab Optimization Toolbox</li> <li>* Multi-Objective Optimization</li> <li>* Integer Optimization</li> </ul> |   |
| <b>Study Goals</b>                      | <p>After successfully completing this course the students should be able to select the most efficient and best suited optimization algorithm for a given optimization problem.</p> <p>They should have insight into the basic operation of some of the most important and relevant optimization algorithms.</p> <p>They should be able to reduce the complexity of the problem using simplifications and/or reformulations so as to augment the efficiency of the solution approach.</p> <p>Finally, they should be able to solve the resulting optimization problem in practice.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |   |
| <b>Education Method</b>                 | lectures + 2 mandatory assignments                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |   |
| <b>Assessment</b>                       | <p>Attending the lectures is not mandatory, provided the recorded lectures and lecture materials are processed via self-study.</p> <p>Written exam (individual, fully closed-book, no calculators nor formulas sheets allowed, counts for 70% of the final marks) + 2 assignments (group assignments, assessed through written reports, count for 30% of the final marks).</p> <p>To successfully pass the course the final weighted average score for the exam and the assignments together should be at least 5.75.</p> <p>Important: Partial marks for the exam or the assignments do not carry over from one academic year to the next.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |   |

| <b>Course Contents</b>                 | Model Predictive Control (MPC) is perhaps the most effective optimal control strategy for constrained dynamical systems. The basic concept of MPC is to exploit a dynamic model to forecast the system behavior, and optimize the forecast to determine the control input as the best decision at the current time. With emphasis on constrained linear systems, the course will present the theoretical fundamentals of MPC, such as Lyapunov stability, optimality and robustness, and its computational methods, such as quadratic programming.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |   |

| <b>Summary</b>                         | In critical systems such as transportation systems, power plants, distribution networks or life-support systems it is not enough to design a control system that meets the required performance levels. It is also of paramount importance to guarantee that such requirements, or a subset of them, are met also during non ideal conditions such as in the presence of physical failures or cyber attacks. Most of all, safety must be guaranteed at all times. This can be obtained by designing into the control system additional functionalities that will allow to detect the occurrence of faults or cyber attacks, and deploy adequate countermeasures, which may include the reconfiguration of the control system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |   |
| <b>Course Contents</b>                 | Faults and failures in dynamical systems; Cybersecurity and cyber attacks to Industrial Control Systems; Components and Services model; Availability and Reliability; FTA (Fault tree Analysis); FMEA (Failure Modes and Effects Analysis); Signal based methods for Diagnosis; Model based methods for Diagnosis; Residuals computation and evaluation; Learning of fault model; Fault Tolerant Control (Model Matching, Virtual Sensor and Actuator, Adaptive Control)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |   |
| <b>Study Goals</b>                     | <p>after the course the student should be able to:</p> <ol style="list-style-type: none"> <li>1) analyse the structure of a system and identify main components, the services provided by each and carry out a Fault Modes and Effects Analysis;</li> <li>2) analyse and model faults or cyber attacks that can occur in a given dynamical system;</li> <li>3) design an algorithm for detecting, isolate and identify them;</li> <li>4) design a policy for reconfiguring the control system in order to accommodate them.</li> <li>5) analyze the vulnerability of an industrial control system to cyber attacks and design prevention and detection algorithms</li> </ol>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |   |
| <b>Education Method</b>                | in person lectures, in-class exercises, homework                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |   |

| <b>Course Contents</b>                 | <p>The course will cover the basics of modeling of both physical systems (in the form of ordinary differential equations), computing and scheduling systems (as finite state machines), and combinations thereof (as hybrid models).</p> <p>Physical systems modeling. The course will cover the basics of Lagrangian modelling, I.e. employing energy balances and the Euler-Lagrange equations to arrive to closed form state-space dynamical equations for system analysis and control design. Bond-graph modelling will be covered as a powerful tool for modelling engineering systems, especially when different physical domains are involved. The basic ideas of model reduction, a technique to reduce the complexity of dynamical models, may also be covered in the course. The fundamental differences and connections between continuous vs discrete time modelling will be discussed. Similarly, frequency domain modelling is also discussed with practical motivations for frequency vs time domain modelling.</p> <p>Finite State Models. A brief introduction to models traditionally employed for computation, e.g. finite state machines, automata, and petri-nets, will be provided. Particular attention will be given to the applicability of these models to provide high-level dynamic descriptions of discrete-event systems and for behaviour specifications of designs.</p> <p>Hybrid systems. The course will finalize with a short introduction to hybrid systems through the formalisms of: Hybrid automata and jump-flow systems, and presenting a brief number of interesting subclasses of hybrid systems, e.g. PWA systems, and timed -automata.</p> |   |
| <b>Study Goals</b>                     | <p>The purpose of the course is to introduce the students to basic concepts and results in physical modeling and the theory of nonlinear control systems.</p> <p>After successful completion of the course, the student is able to</p> <ul style="list-style-type: none"> <li>construct models of physical systems from the knowledge of the basic laws of physics (first principles)</li> <li>construct models of systems using the theory of bond graphs.</li> <li>construct models of systems using the Euler-Lagrange method (perform a model reduction for linear systems using a balanced realization)</li> <li>construct finite state models (automata, FSMs, Petri-Nets) of simple computing and scheduling systems</li> <li>analyze basic properties of finite state systems: blocking, determinism, and language expressed by a model.</li> <li>describe cyber-physical systems as hybrid dynamical models.</li> <li>select the appropriate modelling approach for a given problem.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |   |
| <b>Education Method</b>                | Lectures 0/4/0/0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |   |

| <b>Expected prior knowledge</b>        | Linear algebra, basics of mathematical optimization, basics of probability theory                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |   |
| <b>Course Contents</b>                 | The course will lay the methodological groundwork for machine learning in signals, systems, and control contexts and corresponding application domains. The course covers three modules: supervised learning, unsupervised learning, and reinforcement learning. Throughout the course, students will delve into topics such as linear regression, logistic regression, classification, neural networks, Bayesian supervised learning, and learn about model assessment techniques. In addition, the course covers clustering and matrix factorization, as well as fundamentals of reinforcement learning and its connection with dynamic programming. Furthermore, students will gain insight into model-free RL control algorithms like Sarsa and Q-learning, and approximation methods in value space.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |   |
| <b>Study Goals</b>                     | <p>After this course, the student should be able to</p> <ol style="list-style-type: none"> <li>1. Understand the theory of supervised learning</li> <li>2. Apply state-of-the-art supervised learning algorithms for control applications</li> <li>3. Understand basic unsupervised machine learning methods (e.g. clustering, principal component analysis)</li> <li>4. Understand the link between reinforcement learning and dynamic programming</li> <li>5. Apply RL algorithms like Q-learning or Sarsa for control applications</li> </ol>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |   |
